of living brains. The parallels between animate and inanimate thinking machines are clearly shown, but they are not forced.

Berkeley is writing about revolution, but Pfeiffer is writing about evolution: "The evolution of all other living things has depended on changes in their bodies. But man could evolve indefinitely without any such changes, with the brain he has now. Our kind of evolution depends on cultural changes, on what we learn, on the things we build. In a basic sense, human evolution *is* the evolution of machines, and of these, computers are the most significant. Perhaps more than anything else, the design of artificial-intelligence systems will determine our future as a species."

These books have much to recommend them to both the scientific specialist and the nonscientific layman.

Cognitive Dissonance

Deterrents and Reinforcement. The psychology of insufficient reward. Douglas H. Lawrence and Leon Festinger. Stanford University Press, Stanford, Calif., 1962. vi + 180 pp. $4.75.

This book provides the converse of the familiar and much-debated attempt to apply theories based on animal research to the behavior of humans; it applies the theory of cognitive dissonance, which was originally developed for human attitudes and opinions, to several aspects of the behavior of rats. It deals principally with resistance to experimental extinction, taking as its point of departure the assertion that no previous theory has satisfactorily accounted for the fact that partial reward, delayed reward, and high effort during learning produce responses that are extremely persistent in the fact of repeated nonreinforcement.

Illustratively and sketchily, the assumption is this: a rat that is rewarded on only some of its trial runs down an alley to a goalbox will experience cognitive dissonance on those trials when it is not rewarded because the facts, running-for-food and not-getting-food, are in a dissonant relationship to each other. The authors assume that the rat is motivated to reduce this dissonance and that it will do so, as best it can, by finding extra attractions in the goalbox or in the activity itself. Then, if the original reward is removed, these extra attractions will provide a form of secondary reinforcement to maintain the response.

The book explains this approach in various situations and reports the results of a series of 15 studies designed to evaluate it. By and large the results of these studies are consistent with the stated expectations.

Beneath the surface there are several difficulties, some of them serious. For example, it is not clear whether dissonance results from rewards that is insufficient to the work done or to the level of reward expectation. In any event, expectations play an important role, but their properties are not described. Furthermore, it is not always clear when extra attractions will develop; for example, rats rewarded on every trial during learning could find extra attractions in the goalbox as a result of dissonance encountered on early extinction trials. Such uncertainties make it impossible to draw rigorous conclusions.

However, the authors are aware of many of these problems, and they are reasonably modest in their claims. A tentative and incomplete theory may be very stimulating to researchers. This will almost certainly be true of dissonance theory applied to animal behavior.

On Ways To Study Man

Methodology in Human Genetics. W. J. Burdette, Ed. Holden-Day, San Francisco, Calif., 1962. 436 pp. $4.

This is a collection of 15 papers presented at the symposia held in Salt Lake City, 13 and 14 May 1960. The date of the meeting is not mentioned in the preface of the volume; consequently, the reader may not realize that two full years elapsed between presentation of the papers and their appearance in print. Such publication lags must be remedied in the future.

One common characteristic of these papers is, as the title implies, emphasis on methodology rather than on factual findings. Space here permits only bare mention of the author's name and one or two key words from the title of his paper. Thus, Lilienfeld: sampling and tests; Morton, segregation and linkage; Crow: selection; Steinberg: special cases; Newcombe: linked records; Novitski: computers; Roberts: inherited diseases; Herndon: empiric risks; Cox and MacLeod: susceptibility to infection; Neel: mutations; Ford: cytogenetics; Puck: cell cultures; Sutton: metabolic defects; Hill: hemoglobin structure; Boyd: soluble antigens. Motulsky, Gowen, Tjio, Patau, and others, made substantial contributions to the discussion.

Of course, methodology, the unifying theme of the symposium, has no concrete meaning by itself. Hence, the methodology presented in this volume covers mathematical formulations, sampling procedures, systems of filing records, statistical grinding, clinical diagnosis, microtechniques, tissue culture directions, and biochemical analyses. The papers are no more and no less heterogeneous than those in many other symposium volumes. Most of the papers are very general reviews, but some are carefully organized; some are hastily written, and a few others could have been given a few years earlier without any substantial revision. Nevertheless, I think each review serves a useful purpose.

Reading Novitski's account of computer programming is like reading a story on jaguar hunting in Paraguay. Even those who have never hunted, do not know where Paraguay is, and cannot be sure whether jaguar is a big cat or a motor vehicle, will find the story interesting and understandable.

Earlier genetic studies on susceptibility to infectious diseases in man have not been as fruitful as those on plants and animals where strictly controlled experimentation is possible. The impression that infectious diseases are not amiable to genetic analysis is partially due to the fact that the resultant disease itself has been taken as the object of study. Cox and MacLeod, however, have collected a host of examples to show that, if we study the underlying conditions of a particular organ (presumably having a genetic basis), which lead eventually to higher incidence of infection, then the phenomenon is just as amiable to genetic analysis as any other conditions. Outstanding examples are: In the case hypogammaglobulinemic children, the susceptibility to infections is due to a defective immune mechanism that is genetically controlled; among children with cystic fibrosis of the pancreas the suscepti-

bility to pulmonary infections is due to abnormal respiratory mucus secretion, which is hereditary.

Crow has reiterated his concept of "genetic load". Several of his other statements need clarification for the reader: (p. 59) "The quantity $W_i - \bar{W}$ is called the *average excess* of the allele A_i." The average excess is defined by Fisher (1930, 1941) for two alleles as $W_1 - W_2$ in the present notation. For multiple alleles, the *excess* concept proves inconvenient and is replaced by the *deviation* from general mean, namely, $W_i - \bar{W}$. (p. 61) "An equilibrium may be unstable as well as stable." He means unstable *or* stable. (p. 65) "Persons who are very tall or very short have lower viability than persons of intermediate height." No supporting reference has been given, but Crow called my attention to an article entitled "Build and blood pressure study", (1959, Society of Actuaries). (p. 219) ". . . what is lethal now was not lethal a few generations ago." Apparently he said exactly the opposite of what he meant.

In discussing radiation effects on mice, Gowen presented data to show that radiation, up to a certain amount, has decreased the fertility of females but increased their longevity. Is this a beneficial or detrimental effect? Gowen's answer is simply: "This result will be considered favorable by some but not by others" (p. 193).

In discussing blood group and disease problems, Buckwalter says: "The findings did not indicate differences in frequencies of blood type between the patients and their controls of statistical significance in some instances. However, when the results are pooled, they indicate associations of statistical significance . . . ." This seems a favorite target of attack for Wiener. Is the pooling justified? How is it to be done? For a symposium on methodology, these questions are more important than the associations claimed to be found.

In reading the reports and checking the references, I find the most annoying feature is the collectivized references. The only possible argument for this arrangement is that it avoids the duplication of references. This may lead to a very small saving of space, but it requires a tremendous amount of editorial labor which could be used more profitably. My objection to pooled bibliography, however, is more fundamental. The literature cited *is* an integral part of the paper and should not be broken and intermingled with other unrelated references. One may argue that some other symposium volumes also have pooled bibliography, but that is no justification. Many others do not.

I enjoyed the meetings but I enjoyed reading the reports even more.

New Books

Biological and Medical Sciences

About Biology. Karl von Frisch. Translated from the German by Elsa B. Lowenstein. Oliver and Boyd, Edinburgh, Scotland, 1962. 294 pp. Illus. 25s.

Advances in Agronomy. vol. 14. A. G. Norman, Ed. Academic Press, New York, 1962. 443 pp. Illus. $13.

Animal Parasites, Their Biology and Life Cycles. O. Wilford Olsen. Burgess, Minneapolis, Minn., 1962. 353 pp. Illus. $6.95.

Die Anwendung des Spalthautlappens in der Chirurgie. János Zoltan. Fischer, Jena, Germany, 1962. 391 pp. Illus. DM. 59.20.

Biochemistry of Mental Disease. Theodore L. Sourkes. Harper and Row, New York, 1962. 425 pp. Illus. $12.

Botanical Histochemistry. Principles and practice. William A. Jensen. Freeman, San Francisco, 1962. 415 pp. Illus. $10.

Brain and Behaviour in Cephalopods. M. J. Wells. Stanford Univ. Press, Stanford, Calif., 1962. 171 pp. Illus. $4.50.

Chordate Morphology. Malcolm Jollie. Reinhold, New York; Chapman and Hall, London, 1962. 492 pp. Illus. $8.75.

Design and Function at the Threshold of Life, the Viruses. Heinz Fraenkel-Conrat. Academic Press, New York, 1962. 124 pp. Illus. Plates. Paper, $1.95.

Die enteralen Staphylokokken-Infektionen des Kindes. *Bibliotheca Microbiologica*, pt. 2. M. Kienitz. Karger, New York, 1962. 243 pp. Illus. Paper, $10.60.

The Evolution of Man. G. H. R. von Koenigswald. Univ. of Michigan Press, Ann Arbor, 1962. 148 pp. Illus. Paper, $1.95.

The Eye. vol. 2, *The Visual Process* (814 pp.); vol. 3, *Muscular Mechanisms* (339 pp.). Academic Press, New York, 1962. Illus.

Fortschritte der Zoologie. vol. 15, pt. 2. Max Hartmann, Ed. Fischer, Stuttgart, Germany, 1962. pp. 165–336. Illus. Paper.

Frontiers of Modern Biology. Twenty lectures originally broadcast over the Voice of America. Coordinated by Gairdner B. Moment. Houghton Mifflin, Boston, Mass., 1962. 207 pp. Paper, $1.95.

Hochspannungselektrophorese. Ihre Anwendungsmöglichkeiten für biochemische und klinisch-chemische Trennprobleme. Roman Clotten and Annemarie Clotten. Thieme, Stuttgart, Germany, 1962. 571 pp. Illus. DM. 98.

Human Heredity. C. O. Carter. Penguin Books, Baltimore, Md., 1962. 260 pp. Illus. Paper, $1.45.

Interhemispheric Relations and Cerebral Dominance. Vernon B. Mountcastle, Ed. Johns Hopkins Press, Baltimore, Md. 1962. 304 pp. $7.50.

Introduction to Herpetology. Coleman J. Goin and Olive B. Goin. Freeman, San Francisco, 1962. 350 pp. Illus. $8.

Introduction to Mammalogy. E. Lendell Cockrum. Ronald, New York, 1962. 463 pp. Illus. $9.

Laboratory and Field Manual for Introduction to Mammalogy. E. Lendell Cockrum. Ronald, New York, ed. 2, 1962. 121 pp. Illus. Paper, $4.

The Life of Birds. Joel Carl Welty. Saunders, Philadelphia, 1962. 559 pp. Illus. $9.

The Life Story of the Fish. His morals and manners. Brian Curtis. Dover, New York, 1962 (© 1949). 293 pp. Illus. Paper, $1.50.

Mammals of the Mexican State of Durango. Rollin H. Baker and J. Keever Greer. Michigan State Univ. Museum, East Lansing, 1962. 129 pp. Illus. Paper.

Methods of Biochemical Analysis. vol. 10. David Glick, Ed. Interscience (Wiley), New York, 1962. 408 pp. Illus. $14.50.

Methods of Forensic Science. vol. 1. Frank Lundquist, Ed. Interscience (Wiley), New York, 1962. 671 pp. Illus. $19.95.

Morphologic and Systematic Relationships of Some Middle Ordovician Ostracoda. John C. Kraft. Geological Society of America, New York, 1962. 112 pp. Illus.

The Mosquitoes of the South Pacific (Diptera, Culicidae). vols. 1 and 2. John N. Belkin. Univ. of California Press, Berkeley, 1962. vol. 1, 620 pp.; vol. 2, 412 pp. Illus. $20.

Natural History of Infectious Disease. Sir Macfarlane Burnet. Cambridge Univ. Press. New York, ed. 3, 1962. 387 pp. $6.

Nutrition in a Nutshell. Roger J. Williams. Doubleday, Garden City, N.Y., 1962. 185 pp. Illus. Paper, $0.95.

The Opium Alkaloids. Selected topics. David Ginsburg. Interscience (Wiley), New York, 1962. 111 pp. Illus. $6.50.

The Organization of Cellular Activity. Ch. M. A. Kuyper. Elsevier, New York, 1962. 282 pp. Illus. $7.

Primatologia. vol. 2, No. 1, pt. 3, *Volarhaut der Hände und Füsse.* H. Hofer, A. H. Schultz, and D. Starck, Eds. Karger, New York, 1962. 326 pp. Illus. $21.

Radioisotopes and Bone. Symposium held at Princeton, N.J., August–September 1960. Franklin C. McLean, P. Lacroix, and Ann M. Budy, Eds. Davis, Philadelphia, 1962. 545 pp. Illus. $15.

A Revisional Study of the Masarid Wasps. (Hymenoptera, Vespoidea). O. W. Richards. British Museum (Natural History), London, 1962. 301 pp. Illus. £5 15s.

Viruskrankheiten des Menschen. vol. 1, pts. 2 and 3. Eugen Haagen. Steinkopff, Darmstadt, Germany, 1962. pt. 2, pp. 113–224; pt. 3, pp. 225–336. Illus.
