NEW AAAS SYMPOSIUM VOLUME

# Biophysics of Physiological and Pharmacological Actions

Edited by Abraham M. Shanes. 612 pages. 312 illustrations. 19 tables. References. Index. Price: \$13.50

For AAAS Members: \$11.75 prepaid

The past decade has seen a remarkable extension of concepts related to excitability, permeability, and muscle contraction. The 30 articles composing this volume provide a new basis for understanding many kinds of muscle and nerve cells and various forms of junctional transmission. The subject is one of the exciting borderline frontiers of biological science which has been under attack in recent years from a number of directions.

A birds-eye view of a number of principles and their applicability to a variety of excitable systems that will be useful both in teaching and in research.

soonian method used for studying continuous recognition memory. The method appears to be an elegant technique for this purpose and is applicable wherever the elimination or control of response bias is essential to the matching of theory and experiment (Roger N. Shepard and Jih-Jie Chang, Bell Telephone Laboratories). In quite a different vein, other data on the retention of single events stressed the variability of retention performance as a function of time (Edward A. Bilodeau, Tulane University).

The symposium on Experimental-Theoretical Approaches to Memory was intended to set in juxtaposition the approaches of the neurophysiologist, the psychologist working within the framework of communication concepts and mechanisms, the psychologist working within the traditions of stimulus-response functionalism, and the psychologist working with the new tools for computer-modeling of behavior mechanisms. The principal emphases were concerned with: the "consolidation" hypothesis regarding fixing of neural traces for permanent storage (Ralph W. Gerard, University of Michigan); the dichotomy of short-term and long-term memory storage based principally on the non-dependence of the former on the similarity relations of disrupted and disrupting activities and the well-known dependence of the latter on such relations (Donald E. Broadbent, Applied Psychology Research Unit, Cambridge); the issues raised by evidence that the interference theory of forgetting predicts too much forgetting (Leo Postman, University of California); and the fertility and guidance value of logical, quantitative models, such as are suitable for realization on a computer, for theorizing about memory and learning (Earl B. Hunt, University of California).

The vice-presidential address by Arthur W. Melton was the final event in this series on memory. After identifying a number of current issues in learning theory as issues about the formation, storage, and retrieval of memory traces, the major general issue was identified as the question whether shortterm memory and long-term memory are points on a continuum. An affirmative answer was expressed, based not only on the data of others who have used the method of recall of single tobe-remembered items following a single or very few repetitions, but also on new data that relate the slope of the short-term forgetting curve to the num-

ber of elements or encoded "chunks" in the to-be-remembered unit. Also, new data confirming and extending Hebb's repetition effect in the context of the memory-span experiment were cited as support for the continuity of short- and long-term memory. The principal consequence of this conclusion was suggested as the extension of the postulate of permanence of memory traces to include the permanence of traces established by single occurrences of events in the life of the organism, although the data also seem to suggest preferences among the alternative assumptions offered as solutions to other critical issues in general theory of memory.

The vice-presidential address, the symposium papers, and a number of the other invited papers will be published in a special issue of the *Journal of Verbal Learning and Verbal Behavior*.

## CAREER APPOINTMENTS

# NASA

# **New Key Positions**

The Astrionics Division, NASA Marshall Space Flight Center, is expanding rapidly and seeks eleven scientists and engineers with Ph.D. degrees in physics, mathematics, electronics, and aeronautical engineering.

### **GUIDANCE & CONTROL**

Five positions are available in the following areas:

- Consultant, advisor and special assistant to the Director, Astrionics Division, with responsibility for research and development requiring the adaption and application of engineering and scientific methods, concepts and theories in connection with the electrical, magnetic, thermal mechanical and other physical properties of materials used in guidance and control.
- 2. Studies of various types of guidance schemes and recommendations as to which to apply to different missions based on accuracy, reliability, cost, etc.; detailed studies of other NASA space vehicle guidance systems to provide support and cross-coupling of technical information.
- Investigation of forces and torques for control of future space and launch vehicles and analysis of proposed methods and hardware; flight control studies to determine vehicle maneuvering power and impulse requirements.
- 4. Technical advice on extremely complex problems relating to mathematicalphysical relationship of vehicle dynamics on large space boosters; studies to obtain empirical data for use in solving flight dynamics problems; recommendation of new techniques and theories for consideration in design and development of components.
- 5. Formulation of equations of motion which describe the flight and guidance performance of space vehicle systems. Formulations will include derivation of steering functions and their mechanization as well as derivation involving theory of intertial, radio, and navigational principles. Mathematical analysis of orbital and interplanetary guidance schemes will also be performed.

## FRICTION & LUBRICATION

Analysis of gas bearing characteristics and application of resulting theories to advanced gas lubricated bearing designs; special studies on aerodynamic problems encountered in gas bearing research; comparison of analytical approaches with the characteristics of air bearing hardware as a basis for theory refinement.

## ELECTRONIC FLIGHT & SUPPORT EQUIPMENT

Application of display systems to the launch site computer complex; discern what should be displayed within a check-out and monitoring sequence and propose methods of display which present an operator with the status and operational quality of a system.

## MEASUREMENT & INSTRUMENTATION SYSTEMS

Consultant, advisor, special assistant to Chief, Instrumentation Development Branch, with responsibility for research and development requiring application of engineering and scientific methods in studies of RF systems and aerospace communications; will receive special assignments relating to unprecedented projects on theory and development of vehicle instrumentation and aerospace communications systems.

### HEAT & LIGHT MEASUREMENT

Design and development of complex electronic, electrical, and electromechanical components, apparatus, devices, materials and parts required for guidance and control systems of space vehicles; advisor and physical researcher in quantum electronics and quantum physics; investigation of possibility to construct optical frequency counterparts or new devices for performance of guidance and communication functions.

## SENSORS & TRANSDUCERS

Seek solution to theoretical problems related to gyros and accelerometers; perform studies on gyro performance parameters and apply the results to gyro dynamic analysis; analyze gyro motor characteristics and application of results to new gyro designs.

### AUTOMATED CONTROL SYSTEMS

Establish mathematical and analog simulation methods for analysis of gyro and gimbal axis suspensions; establish basic approaches for research and development of intertial sensing and measuring elements.
