Blood Flow Through Muscle

A group of investigators in the physiological research field convened on 9 March 1963 in Los Angeles to discuss the various aspects of circulation of blood through skeletal muscle. The meeting was primarily an open discussion which included only active, expert workers in this field.

A discussion on the topography of microcirculation in skeletal muscle emphasized the existence of several alternative routes which conduct blood from the arterial side to the venous side. It called attention to the dichotomy between blood flow in fascicular membranes and that through the muscle bundles, and noted how two qualitatively different paths exist within the muscle itself (B. W. Zweifach, New York University). The silicone elastomer injection technique was pointed out as a method for capturing permanent representations of peripheral vascular beds in various physiologic states. Thus, differences between resting muscle and hyperemic muscle can be dramatically displayed. Many questions concerning this approach to the measurement of distensibility of the components of the microcirculatory bed were discussed (Sidney S. Sobin, Loma Linda Universitv).

Further studies on muscle blood flow described responses of muscle circulation to combinations of exercise and catechol amines, and the general concept of the interrelationship between local and central determinants of muscle flow was introduced (A. D. M. Greenfield, Queen's University, Belfast). Recent attempts have been made to separate blood flow through skin and muscle in the human forearm by use of the venous oxygen saturation method. Diversion between these two venous beds may occur under the physiological circumstances where such a measurement is required (John Shepherd, Mayo Foundation).

A report on blood content presented data on the concentration of norepinephrine and its metabolic breakdown products in venous blood draining muscles at rest and during stimulation of their sympathetic supply. There seem to be highly significant differences in the total quantities and the relative amounts of these substances in the venous blood under the conditions studied (Sune Rosell, Karolinska Institutet. Stockholm). One aspect of research was covered in a talk on changes in strength of muscle contraction, local blood flow and tissue clearances in rhythmically stimulated, perfused skeletal muscles during superimposed intraarterial infusion of acetylcholine and d-Tubocurarine (Ralph Sonnenschein, University of California). Other significant reports noted the importance of tissue fluid and lymph removal as determinants of nutritional supply to skeletal muscle (J. P. Henry, University of Southern California School of Medicine) and the redistribution of flow between shunt and nutritional pathways in skeletal muscle under conditions of local production of dilator substances (Chester Hyman, University of Southern California School of Medicine).

Participants felt that before any overall hypothesis relating local and systemic influences could be formulated, more detailed information and research would be required. It was also noted that data obtained in the many distinctly different types of preparations would have to be collated and re-evaluated in order to establish the true picture.

SCIENCE, VOL. 140

Performance, Reliability and Quality—your best buy

Quality and simplicity of design make the recti/riter® recorder an outstanding, reliable performer. Utilizing a large, powerful magnet, the recti/riter recorder offers maximum sensitivity, fast response time, and low input impedance

—requires less damping circuitry. True rectilinear recording using the proven veloped by Texas Instruments in 1956—the widest selection of ranges and chart speeds—plus exclusive operator convenience features have made the recti/riter a first choice of the most demanding user. There is a recti/riter to fit your particular requirement: single and dual channel in both portable and flush-mounting models. Write for complete information.
