

## MICROFOCUS X-RAY DIFFRACTION GENERATOR

Features Three
Interchangeable Tubes
— Loadings up to 10 mA

This new high-power Microfocus X-ray unit has high brilliance, fine focus (line or spot) and generous table-top space around tube for equipment. The generator can be supplied with a choice of tubes and focusing guns with a loading up to 50 kV, 10 mA — a range providing electron beams accelerated either horizontally or vertically.

This versatile generator, when used with the new two-circle or single diffractometer (as illustrated), offers extremely high resolution and sensitivity—and permits broader applications for Hilger X-ray diffraction cameras, goniometers, and other accessories.

phasized data and viewpoints that do not fit well with current theories. Data on adaptive enzymes suggest that the genes which determine them are not, as commonly thought, blocked by suppressors. Rather, these genes (and others?) are normally inactive until activity is induced by the appropriate substrate. The complexity of most enzymes and hence the probability that they must be determined in several steps is a theoretical stumbling block for the one gene-one enzyme theory. However, it may be illusory if the several determining units comprise one operand, which function (or fail) together. Finally, he expressed grave doubts that chromosomal proteins are as inert as commonly supposed. Specifically, he suggested that they might form complexes to bind materials upon which the genetic DNA acts. G. H. Dixon (University of Toronto) discussed studies by himself and G. E. Connell on human haptoglobins, studies carried out by starch-gel electrophoresis. These experiments suggest the possibility that unequal crossing over, eliminating small segments of DNA, and duplicating others, might result in losses of specific amino acids from the haptoglobin molecule while other parts of the molecule are duplicated.
