

driving forces, and intermediate values of contact angle.

F. P. Price (General Electric Research Laboratory) discussed nucleation and growth of single-crystal organic polymers, and presented evidence that classical nucleation theory applies equally satisfactorily to polymer crystals and to materials of low molecular weight. Specifically, it was shown (i) that the thermal history of organic solids controls the size of crystalline spherulites and (ii) that for polychlorotrifluoroethylene there is correlation between spherulite size and fatigue life. In particular, rapid quenching results in small crystals, capable of greater reverse bending before fracture occurs; whereas slow cooling creates crystals of such size that single bending causes failure. The stress-strain curves of polypropylene exhibited similar characteristics but, through annealing for increased periods of time, the total possible elongation can be reduced. This in turn possibly results in immediate fracture after the initial upper yield.

P. G. Shewmon (Carnegie Institute of Technology) introduced the subject of surface diffusion with an examination of the experimental techniques used in the determination of the surface diffusion coefficient D_s . The controversy as to whether volume or surface diffusion plays the major role in the process of fine powder sintering was then explored. Shewmon suggested that surface diffusion is the all-important factor to be considered, contrary to the conclusions arrived at in most of the literature on this subject. Recent extensive computer studies, however, substantiate this minority belief, he pointed out. The basic argument was developed as an extension of the observed results of scratch smoothing experiments; these experiments showed the wavelength of a grating surface to be an important parameter in the determination of the ratio of surface to bulk diffusion.

C. E. Birchenall and J. M. Williams (University of Delaware) took the general position that these subjects—surface diffusion, surface diffusion versus bulk diffusion, and the relation of these to the sintering process—were more complex and should be more closely considered. Among the factors that should be examined, for example, in any consideration of surface diffusion are surface impurity size and distribution, crystalline anisotropies, divacancy migration through the surface,

the long mean free paths at high temperatures, and the chemical effects that “pin” atoms to adsorbed species. Commenting particularly on the sintering process, Birchenall and Williams thought that neck size, not particle size, as is usually thought, was more important in a determination of a surface diffusion mechanism. They also discussed tracer technique experiments which they had been performing recently. The conclusion, however, was that the end results of these experiments might not shed any more light on these general problems than presently existed.

J. M. Blakely and C. Y. Li (Cornell University) discussed the formation of surface point defects on ionic crystals and showed that about 2.12 eV of energy is required to create a divacancy on a (100) NaCl crystal surface, compared to 1.95 eV for the creation of a similar double effect in the bulk material. The legitimacy of the use of the bulk dielectric constant in the neighborhood of a surface was questioned. It was pointed out that a correction to this value would have the effect of increasing the polarization component of the removal energy, thus making it more difficult to create a surface defect pair.

I. R. Kramer (Martin Company) spoke on surface-initiated failures in structural materials. His basic premise was that the mechanical behavior of materials, particularly metals, is markedly affected by the surface; that all of the usual mechanical properties—tensile behavior, fatigue, creep, stress-rupture—can be altered by suitable surface changes. For example, copper-plated zinc crystals reduce creep rate to negligible values. It was also pointed out that various atmospheres produce different and readily observable effects on materials. For example, specimens tested in vacuum are able to deform plastically more readily than those tested in air.

J. Turkevich (Princeton University) spoke broadly on the subject of ultra-fine particles in gases. Regarding the nucleation, growth, and aggregation of fine aerosol particles he suggested that their formation and also their texture are due to a certain degree of information or memory in an organized aggregate of materials. His view has been documented by electron-microscopy examinations of particles in a finely divided state. Other unusual characteristics of the growth of such particles in gases are that, in contrast

to the case of crystallites, there are no driving forces to promote growth, and that these particles are so nearly perfect that the so-called “growth sites” associated with dislocations are not found to exist. It was explained that in the preparation of such fine particles it was always necessary to perform some preliminary burning off of debris (carbon). This burning is not as simple a task as might be presumed, because the burning rate—dependent on surface area—will decrease as the particles become smaller. Another problem associated with the formation of such fine particles is the dissipation of the energy generated at the surface. Usually this is accomplished through absorption by the “bulk.” With such fine particles, however, there is usually no bulk; thus the carbon burning cannot be sustained. Room-temperature burning, using oxygen produced in a discharge tube, however, can be accomplished to a finer degree, and no side effects are introduced into the materials from which the carbon is removed. Next, it was explained that, contrary to usual belief, magnesium atoms do not aggregate to form well-defined hexagonal crystals. With the addition of small amounts of copper impurities, crystal growth is promoted and such perfect hexagons do appear. In closing, it was shown that there is a very practical application of these aerosol studies—namely, the use of fine particle technology in the study of radioactive fallout.

The sponsor of the symposium was the Ilikon Corporation, Natick Industrial Center, Natick, Massachusetts. A symposium volume is being prepared; requests for copies should be addressed to Ilikon Corporation.

NEW "OAK RIDGE" TYPE PLASTIC CENTRITUBES™

"Oak Ridge" type screw-cap Centritubes do away with time-consuming metal sealing caps used in preparative ultracentrifugation, and at a fraction of the cost.

With a simple twist, they provide all the liquid tight sealing protection of costly multi-piece metal sealing caps. They are available in 10, 30, 50 and 85 ml sizes; two materials: Autoclear polycarbonate or polypropylene; and in two types: narrow and wide mouth. Narrow mouth bottles are ideal for working with infectious materials as the cap does not come in contact with the material. Caps are polypropylene.

At the Climax, Colorado observing station of the High Altitude Observatory, Chief Observer Bob James uses a Model 130 portable laser to align optics of one of the world's largest (40.6 cm) coronagraphs.¹ Laser is also used to align the observatory's spectrograph.

Portable laser makes light work of observatory's alignment tasks

Riding the solar flare patrol can be an exciting job, particularly if you're working in the clear, crisp air of a place like the Climax, Colorado observing station of the High Altitude Observatory. From there you get to see some really spectacular solar scenery. But the work can be tedious, too, when you have to forego your observation for long periods of time while you painstakingly align your optical equipment. And sometimes that's just when you miss the best shows.

But the work of aligning the complex optical equipment has now become easier. Procedures that once took days are now accomplished in hours, thanks to a new labor-saving device called the Spectra-Physics Model 130 gas laser. With their portable Model 130, observatory scientists align the optics of coronagraphs and spectrographs, in bright daylight if desired, with none of the focusing or other problems experienced using a point source of light.

Whether you're working in an observatory, a laboratory, or a classroom, you'll find the Model 130 cw gas laser offers you far more in precision and performance than any other laser at anywhere near the price. May we send you literature, and put your name on the mailing list to receive Spectra-Physics Laser Technical Bulletins? Write us at 1255 Terra Bella Avenue, Mountain View, Calif.

New, high output (0.75 mw uniphase power) Model 130B cw gas laser, 6328A (1.15 μ or 3.39 μ optional) completely self-contained; 13 lbs; price \$1225

REICHERT

New COMBINATION Phase Contrast & Anoptral Contrast Microscopy with Laboratory Microscope "BIOZET"

A new dual purpose turret condenser of high resolution and a sextuple nosepiece accommodating any combination of six Phase and Anoptral objectives, enables convenient observation and comparison of Phase and Anoptral* contrast images. The Reichert "Biozet" with centerable condenser holder and built-in low voltage illumination is ideally suited for this and all other investigations in transmitted light and for photomicrography.

*Anoptral contrast is negative phase contrast with colored background added to enhance contrast.

WACO LO-TEMP BATH

COOLS HEATS

ONLY...\$440.

SEVEN WAYS BETTER

- 1 Heats and Cools—almost double the range of the average visibility bath.
- 2 Accuracy—constant temperature at any level from -10°C to $+65^{\circ}\text{C} \pm 0.1^{\circ}\text{C}$ —ideal where precise temperature control is required.
- 3 Large Capacity—coils fit snug against the bottom, the entire volume of the jar is usable. Glass jar permits fast observation.
- 4 Compact—only $20\frac{1}{2}$ " wide $27\frac{1}{2}$ " high. Saves space. Fits on any lab table or desk.
- 5 Self-contained—heating controls, cooling compressor, all parts are housed in this compact unit.
- 6 Low Maintenance—Waco Lo-Temp has been proved trouble-free by laboratories from coast to coast.
- 7 Low Price—\$440.00.
Specify: No. 882 Waco Lo-Temp Refrigerated Bath, complete with Pyrex jar 12" in diameter, for 115 volt 50/60 cycle AC

Other sizes and accessories available to fit your needs. Write for Waco Bath Bulletin for complete information.
