

that in metallo-oxygen complexes, the total number of electrons within the complex may be determinable but, since the charge distribution may vary continuously, it is frequently pointless to assign a discrete structure in which a particular electron distribution between the metal and the oxygen is designated.

Profound insight into the regulation and catalytic mechanisms of the oxygenases awaits future empirical and conceptual advances. It is evident, however, that this colloquium has richly contributed to these ultimate goals. The proceedings of this conference have been published in English as "Biological and Chemical Aspects of Oxygenases," edited by K. Bloch and O. Hayaishi, and may be purchased for \$6.95 from Maruzen Company, 6 Tore Nichome Nihongashi, Chuoku, Tokyo, Japan.

VICKERS Excellence... The Image-Splitting Measuring Eyepiece

Three hundred and twenty-seven years ago, William Gascoigne of Yorkshire constructed a micrometer measuring device suitable for use in the relatively crude optical instruments of that day. Since 1639 many refinements have been made upon Gascoigne's achievement — but these were refinements only. The first basic advance in microscope measurement technique occurred only recently — in 1962 — with the introduction of the Vickers-A.E.I. Image-Splitting Measuring Eyepiece. ▼ The image splitting technique makes obsolete (for nearly all purposes) Gascoigne's family of filar micrometers and eyepiece gratitudes. The image splitter is much more accurate. It is faster and more convenient to use. It has an entirely unique capability for instantaneous, multiple comparative measurements. ▼ Nearly one thousand Vickers Image Splitters are now being used by your colleagues and competitors. Here are just a few of the things it can do for you.

- Measure with accuracies up to better than 0.1 micron (0.000004")
- "Dial in" sizes so that objects anywhere in the microscope field can be checked for conformity — *without measurement*.
- Make particle size analyses — *without measurement*.
- Measure moving or vibrating objects.
- Measure without the possibility of parallax error or errors due to microscope instability.

If accurate and fast measurement techniques are essential in your work, please let us know. We will immediately send our descriptive brochure.

linear fraction collector

FRACTOMAT is one of the most compact fraction collectors available, yet offers features not found in larger units. It provides drop, time and volume (syphon or photoelectric) collection directly into an unlimited number of test tubes. A safety teflon valve prevents stray drops falling between test tubes or loss of sample due to power failure. Adapters available for micro-collection.

COEFFICIENTS OF FRICTION OF

METAL, PAPER, PLASTICS,
RUBBER, TAPE, YARN, ETC.

Model CS-152

Slide Angle Tester was developed by St. Regis Paper Co. and provides coefficients of static friction by indicating the critical angle at which the test block slides down a motor driven plane.

Model CS-131

Frictionometer was developed by Bell Telephone Laboratories and measures coefficients of friction through the velocity spectrum from static to 500 cm per second.

Model CS-151

ATLAB Yarn Friction Tester was developed by Atlas Chemical Industries, Inc. and provides friction measurements of likely prospects in search for finishes and lubricants with optimum yarn and fiber processing qualities from 0.1 to 40,000 cm per minute.
