This latter concept was explored to some extent in a symposium on "Relationship of Chemical Structure to Mechanism of Antibiotic Action," convened by F. C. Neuhaus (Northwestern University). The specific requirements for "genetic code misreading" type antibiotics were discussed by Julian Davies (University of Wisconsin) and cell-wall peptide synthesis inhibition at the cycloserine sensitive "spot" by Neuhaus. As more information is gained on the relations of structures to mechanisms of action, it should be feasible to modify other antibiotics in such a manner to include the moieties having the needed features.

Among the new antibiotics mentioned which will probably have an impact on chemotherapy on infectious diseases were: (i) Monensin, an acidic antibiotic with high anti-coccidial activity in laboratory and field tests. The chemistry of this antibiotic has been worked out in the Lilly Research Laboratories and the structure proposed (on the basis of x-ray analyses and chemical degradations) shows it to be one of a new family of antibiotics containing linked pyran rings; (ii) Tenemycin, a new member of the neomycin group with much lower toxicity than any of the reported deoxystreptamines; and (iii) Halomicin, an anti-gram positive bacteria product from Micromonospora species.

In other papers presented at this meeting aspects of the chemistry of stendomycin and saramycetin were reported and the complete structures of streptovaricin A and streptozotocin proposed. (The latter may be of long term interest due to its diabetogenic activity in a variety of animals.)

Other features of the meeting included a roundtable discussion on "Optimal Duration of Antibiotic Therapy in Severe Bacterial Infections" organized by W. M. M. Kirby) in which the participants stressed the factors behind the great variability that exists between medical centers in the treatment of pyelonephritis, meningitis, endocarditis, pneumonia, and gastroenteritis. In the course of a symposium on "Antibiotic Synergism and Antagonism" E. Jawetz mentioned that Maimonides' advice (given 800 years ago) "If one can manage well with one drug, one should not use a compound one . . . one should use medications compounded of multiple ingredients only when compelled to do so" should be recognized as still useful.

Most of the papers presented at this

conference will appear in Antimicrobial Agents and Chemotherapy-1967, which will be published in June 1968 by the American Society for Microbiology, 115 Huron View Boulevard, Ann Arbor, Michigan 48103.

Plans for the 1968 Interscience Conference are already under way. The sessions will be held 23–25 October 1968 in the Commodore Hotel, New York City. C. W. Pettinga (Eli Lilly and Company) will be chairman. The deadline for abstracts of papers to be presented at this 1968 meeting is 1 July 1968.

The conference was sponsored by the American Society for Microbiology and the sessions on clinical subjects are arranged with the support of the Infectious Diseases Society of America.

Calender of Events

Courses

Biology of Mollusks, Hawaii Institute of Marine Biology, 17 June–6 September. A graduate research training program in molluscan biology, sponsored by the National Science Foundation. Participants will explore structure, function, and adaptive radiation in the mollusks, with emphasis on such topics as functional systems, developmental biology, analysis of behavior, population biology, and role of mollusks in biotic communities. (Dr. Philip Helfrich, Summer Training Program, Hawaii Institute of Marine Biology, Coconut Island, P.O. Box 1067, Kaneohe 96744)

Neuromuscular Diseases of Children, Chicago, 3–14 June. An intensive didactic and clinical course designed for pediatricians, orthopedists, neurologists, psychiatrists, and physiatrists interested in the care and treatment of children with neuromuscular handicaps. Emphasis will be placed on the practical clinical aspects of treatment and rehabilitation procedures. Fee: \$315. (Registrar, Cook County Graduate School of Medicine, 707 South Wood St., Chicago, III. 60612)

Mechanics Summer Series, Fracture Bethlehem, Pa. The two courses offered are for practicing engineers and scientists working in research and development, design and materials selection, manufacturing, quality control and inspection, testing, and/or failure analysis. Workshop in Fracture Mechanics (2-14 June) will encompass theoretical and physical foundations, stress intensity analysis, electron fractography, experimental testing, and design applications. Fee: \$375. Advanced Fracture Analysis (9-14 June) will encompass the analysis of fracture criteria, separation mechanics, viscoelasticity, fracture of inhomogeneous media, multiple mode failure and dynamic crack behavior through

the use of two- and three-dimensional stress analysis and advanced mathematical models. Fee: \$225. (Universal Technology Corp., 1388 Research Park Drive, Dayton, Ohio 45432)

Oceanography, Stanford Oceanographic Expedition 20, 16 September-1 December. The expedition will leave Guayaquil, Ecuador, on 16 September for research in the eastern tropical Pacific, and will terminate in Monterey, Calif., on 1 December. The cruise will provide the opportunity for almost all types of "blue-water" biological oceanographic research, but will tend to concentrate on the reproductive cycles and food chain relationships of the abyssal benthic communities of the region. The expedition represents an intensive 15 quarter-unit graduate level course in biological oceanography given at sea by a faculty of three. Ten NSF awards covering room and board, transportation to and from the vessel, and full tuition are available. Applicants must be research-oriented graduate students in biology, in good academic standing and excellent physical and emotional health. Deadline for applications: June. (Professor Malvern Gilmartin, Hopkins Marine Station, Pacific Grove, Calif. 93950)

Research Instrumentation, Brooklyn N.Y., 20 July-10 August. A laboratory course in basic electronics and instrumentation techniques designed for engineers, physical and biological scientists, and science educators who must use instruments in their work. Fee: \$50. *Deadline for applications: 15 May*. (Professor Kenneth R. Jolls, Department of Chemical Engineering, Polytechnic Institute of Brooklyn, Brooklyn, N.Y. 11201)

Physical Measurement and Analysis, Massachusetts Institute of Technology, 11–21 June. Is intended for professional people who make and analyze measurements or who design experimental equipment incorporating measuring apparatus. Fee: \$400. (Director of the Summer Session, Room E19-356, Massachusetts Institute of Technology, Cambridge 02139)

Freeze Etching and Scanning Electron Microscopy of Biological Materials, University of California, 24–28 June. Is designed to provide theoretical background and laboratory experience in the use of the scanning electron microscope in conjunction with freeze etching. Participants are expected to have a background in biological electron miscroscopy. Fee: \$300. (Letters and Science Extension, University of California, Berkeley 94720)

European Library Study Tour, 22 July-12 August. The trip is open to students currently enrolled in library schools, to professional librarians, and to persons meeting the entrance requirements of the Library School. Enrollment is limited to 30. Participants will visit Dublin, Lon-Stock-Copenhagen, Gothenburg, don. holm, Frankfurt, Amsterdam, Brussels, and Paris. The study tour will carry four quarter credits at the graduate level. Fee: \$140 plus \$10 admission fee. Travel cost: Approximately \$981. Deadline for applications: 5 June. (Mrs. Margaret D. Warrington, Administrative Assistant, Graduate School of Library Science, Drexel Institute of Technology, 33rd and Lancaster Ave., Philadelphia, Pa. 19104)
