AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

How do you choose among the three best amino acid analyzers?

Look them over. You'll find certain important similarities. All three are Beckman instruments—sturdy and dependable with high sensitivity. All give you the same superb resolution and repeatability of results. The difference is volume. If you want an analyzer that can work days, nights, and weekends—without operator attention—the new Model 121 is the choice. It injects and analyzes up to 72 samples in sequence—all automatically. If that is more than you need, check the classic Model 120C—it is referred to more often in the technical literature than any other analyzer. Or if the workload is light, consider the modular Model 116—and add capabilities to it as your needs change. The considerable benefit of Spinco Field Service Engineers—a nationwide force of them, knowledgeable in instrumentation and methodologies—is available to you whichever analyzer you choose.

For more specifics, write for Data File AAA-5.

Micro-sampling is just one capability of two new spectrophotometers, the Beckman IR-18 and IR-20. Both are equipped with mind-freeing conveniences that gain you think-time.

Until now, you could find the versatile capability of the IR-18 and IR-20 only in a research-priced instrument. Now in addition to precise micro-sampling performance, you gain a combination of work-saving benefits. Operation is simple. Standout features include coded controls for routine (O), fast (Δ), and high resolution (\square) scans... automatic scan and reset... 75 pre-calibrated charts/roll... 7 slit programs... scale expansion... 9 speeds, from 6 minutes to 50 hours... abscissa expansions of 4X and 10X without an external recorder... a

large, easily accessible sample compartment... built-in circuit tests. Data is presented on a flatbed, strip chart recorder. Accuracy and reliability are unexcelled in any other moderately priced IR instrument. IR-20's wave number range is 4000-250 cm^{-1} ; IR-18's is 4000-600 cm^{-1} . For complete details, contact your Beckman representative or write for Data File #202.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

COVER

Beetles of the genus *Acmaeodera* mimic bees and wasps in flight by flying with their membranous hindwings only and by having their forewings adorned with the color markings of Hymenoptera. Specimen shown is tethered to a wire (about $\times 14$). See page 486. [R. Silberglied and T. Eisner, Cornell University]

There's an important new name in the Toronto telephone directory. **Brinkmann Instruments.**

When the new Toronto telephone directory comes out, we're pleased to announce you'll find Brinkmann Instruments (Canada) Ltd. listed in it. In the meantime, why not jot down our Toronto telephone number: (416) 677-1911. Now that we have a full-fledged operation north of the border, we'll be able to provide really prompt delivery service and technical attention to laboratories in Canada interested in any of the numerous products with which the name Brinkmann is synonymous.

Whether you already use or someday plan to

use the Eppendorf Microliter System and Pipets, Lauda Constant Temperature Circulators, E. Merck AG (Darmstadt) chemicals, sorbents and pre-coated TLC materials, EM-Test® Clinical Diagnostic Reagents, the Ronor Counter Current Column, the Brinkmann Fraction Collector, Wenking Potentiostats, or Brinkmann's wide range of electrophoresis apparatus and micromanipulators, it may be helpful to remember that now Brinkmann is in Canada, a lot closer to home.

We calibrated this pump for you.

You don't have to recalibrate it to change flow rates, or after cleaning, or for use after a long idle period. You don't have to replace peristaltic tubing or tolerate the pulsation of an interrupted stroke piston pump. The ISCO Model 300 Metering Pump has a Teflon diaphragm driven by a solid state servo mechanism. Exact flow rates are read directly from dials on the face of the pump without referring to calibration tables. Accuracy and reproducibility are maintained at flow rates from 0 to 500 ml/hr at pressures to 50 psi. All parts contacting the pumped liquid are constructed of Teflon, Kel-F, glass, or similar chemically resistant materials.

Write for brochure MP37 for complete details.

their objections to the planned visit of the *Silas Bent*. Thereupon, just 3 days before the meeting was to begin, the society hastily canceled its invitation to the *Silas Bent* in order to prevent a threatened student riot.

Subsequently at the meeting many oceanographers informally expressed their disappointment at being deprived of an opportunity to explore the *Silas Bent*—a modern research vessel currently operating in Asian waters and one which has made very extensive and interesting oceanographic studies. "Student power" had effectively destroyed an important aspect of the meeting for 800 members of the society and also, because of the last minute nature of the protest, had prevented the members from even conducting a referendum of their own wishes in the situation.

The implications of this incident are ominous. Until now, oceanography has enjoyed a most cosmopolitan atmosphere. Many countries invite foreign oceanographers to participate in their oceanographic expeditions. International cooperation has been our theme. We cannot afford to quibble about political differences as we study oceans which are truly international and under the jurisdiction of no one country. I hope oceanographers everywhere will join to preserve the peaceful immunity from national controversy which it has had heretofore.

P. KILHO PARK

Department of Oceanography, Oregon State University, Corvallis 97331

Albert Tyler

Albert Tyler, embryologist and professor of biology at the California Institute of Technology, died 9 November 1968 in San Marino at 62. Tyler was the first student to receive a Ph.D. in biology at the Institute, and he was the last graduate student of Thomas Hunt Morgan. His career spanned the years which witnessed the transformation of experimental embryology, a branch of classical zoology, into modern developmental science, whose strongest influences come from genetics and molecular biology. Tyler actively participated in this metamorphosis. Although thoroughly familiar with classical embryology (especially of marine invertebrates) and to an unusual degree appreciative of the historical foundations of contemporary biology, he welcomed novel approaches and new ideas. He was

among the first to apply modern physiological and biochemical methods to the study of development. His first paper embodying this approach, "On the energetics of differentiation," was published in 1933 following a period of postdoctoral work in Warburg's laboratory.

Tyler's name is also closely associated with the chemistry and physiology of the fertilization process and with the fertilizin-antifertilizin theory. He and his students extended and refined Lillie's original hypothesis and proposed plausible mechanisms for the main features of fertilization. These concepts stimulated fruitful studies on reproduction in higher organisms and helped create the field of "immunoreproduction." During the last 10 years Tyler became involved, with characteristic drive and enthusiasm, in studies of the macromolecular events during embryogenesis in the sea urchin. He was especially interested in "masked messenger RNA," the synthesis of which he correlated with the onset of embryonic determination. He was convinced that informational RNA would some day be clinically useful, and he performed numerous experiments basic to that ultimate achievement. Related to the masked messenger concept was his interest in the properties and developmental role of cytoplasmic DNA, which he explored actively during his last years.

Tyler was a former president of the American Society of Naturalists and the Society of General Physiologists. He had a long association with the Marine Biological Laboratory at Woods Hole, of which he was a trustee for 14 years, and was active on numerous government committees and in the World Health Organization.

As former students or associates, we have lost a dear friend, and science has lost a devoted scholar.

Q From all the published research in which preparative ultracentrifuges were mentioned over the past 8 years or more, list the papers that give methods, gradients, rotors, speeds, and run times for the material of interest to you. (You have 5 minutes.)

A. _____

Impossible, you say, without a lengthy library search? Not true. The search has been made—and the results are compiled in a new, annotated bibliography. It is a guide to the original literature that will save you hundreds of hours of library time. In addition to full title and reference, each entry also includes specific material studied, rotor(s) used—plus other pertinent information to help you find the appropriate literature as quickly as possible. More than 4,500 entries. More than 120 pages.

Entries are grouped by general category of materials studied, e.g., viruses, enzymes, etc., with sub-divisions according to methods—density techniques, analytical techniques that do not employ density gradients, preparative techniques that do not employ gradients. Under each technique specific materials are arranged alphabetically, e.g., RNA, Bacteriophage MS2; RNA, Rat pituitary; RNA, Toad bladder, etc.

This is the most comprehensive, helpfully designed bibliography ever compiled on preparative ultracentrifuge applications. Order it now—at special pre-publication price of \$10.00. Use handy coupon below.

Our Nation and the Sea

The world has entered an era in which the oceans are commanding increasing attention. One expanding activity is the exploitation of undersea resources. During the past four years, production of petroleum from the U.S. continental shelves has doubled, and the output is now valued at more than \$1 billion annually. To date, all production of offshore petroleum in commercial quantities has been from wells in waters 340 feet deep or less, but exploratory wells have been drilled at water depths of 1300 feet, and leases have been taken to 1800 feet. Already U.S. industry has spent \$13 billion in exploiting domestic offshore petroleum resources, including \$4 billion in lease bonus and rental payments to the government.

Alert to the growing importance of marine affairs, Congress has shown concern that national policies be adequate. Of special significance was the enactment of Public Law 89-454—the Marine Resources and Engineering Development Act of 1966. This law established a national policy to advance marine sciences and created a Cabinet-level council and advisory commission. The council, consisting of high-level government officials, has worked under a diligent chairman, Hubert H. Humphrey. It has dealt with substantive policy problems, involving marine science, that touched the jurisdiction of two or more government departments. The work of the council has resulted in 20 presidential policy statements. The council's staff, under its director, Edward Wenk, Jr., produced three excellent annual reports on marine science affairs, including one recently released.*

The Commission on Marine Science, Engineering and Resources has also reported recently on its activities.† The commission, consisting principally of nongovernmental members, served for 2 years, under the chairmanship of Julius A. Stratton. Its report contains much thoughtful comment and many recommendations. Naturally, it devotes considerable space to organizational and budgetary matters. About a score of federal agencies are involved in marine affairs, and no one agency has primary overall responsibility. The report recommends consolidation of many of the activities into one organization. Important matters considered in the report are questions of international rights to the sea and sea bottom, management of the coastal zone, the food resources of the seas, and means for increasing the national capability in marine affairs. The recommendations include establishment of national laboratories for marine science in universities, federal support of fundamental marine technology, and national projects for meeting challenging goals. The proposed fundamental technology includes development of special materials and of reliable power supplies capable of operating at great depths. The national projects are designed to force rapid advancement of knowledge and technology. Among the projects recommended are laboratories on the continental shelf and deep-exploration submersible systems capable of carrying men to a depth of 20,000 feet.

One project is of special significance to landlubbers. It is a proposed multifaceted effort to restore water quality in a lake of "manageable proportions." Lessons learned from such a study might be applicable to the Great Lakes.

The two new reports are of interest to many scientists. By reason of their sponsorship they will probably affect national policy. They could well serve as models for other aspects of science relating to public policy.

—PHILIP H. ABELSON

* *Marine Science Affairs—A Year of Broadened Participation* (Government Printing Office, Washington, D.C., 1969). † *Our Nation and the Sea* (Government Printing Office, Washington, D.C.; publication date, 5 February).

You can reconfigure this multiparameter analyzer in 10 minutes.

Hewlett-Packard's new multiparameter analyzer systems use HP computers to simplify control and give extra flexibility to your analysis.

A specially written software package lets you configure—and later reconfigure—the system to suit each experiment. In 10 minutes, via the teletype, you can optimize core storage for count capacity vs. number of channels. For one experiment, you may want maximum counts/channel for statistical validity. For another, you'll want maximum number of channels for utmost resolution. Want both? You can add core storage easily, up to 8K in the mainframe. With HP's special subroutines there's no need to write any program to get on the air. But, if you like, you can add your own subroutines in FORTRAN, ALGOL, or assembly language.

Added to this operating convenience is the complete modular flexibility of both computer and analyzer. You buy only as much of a system as you need to start with. Later, you can add larger core memory, more analog-to-digital converters, scalars or peripheral devices such as magnetic tape and disc storage.

The minimum system, the HP 5405A Single Parameter Analyzer System, contains a single display, one ADC, the HP 2115A Computer with 4K memory and a teletypewriter. It operates in pulse-height analysis and sampled voltage modes.

The HP 5406A Multiparameter Analyzer System can have two ADCs, optionally expandable up to 16 with a multiplex control. With two ADCs, it operates in the coincidence mode with resolution in the microsecond range. External coincidence equipment can be added to give nanosecond resolution. Software sub-routines generate three display modes: isometric shown here, contour and X-Y slice.

No other nuclear analyzer offers such flexibility and ease of operation. No other system combines the advantage of both an HP instrumentation computer and an HP multichannel analyzer—with software written for the nuclear physicist. Price of the 5406A Multiparameter Analyzer System with two ADCs, under \$37,000.

Call your local HP field engineer for a complete description of both systems and accessories. Or write Jim Sheldon, Hewlett-Packard, Palo Alto, California 94304; Europe: 1217 Meyrin-Geneva, Switzerland.

This isometric display of Co⁶⁰ coincidence spectra was generated by an HP 5406A Multiparameter Analyzer System using 64 x 64 channels.
