## SCIENCE 14 February 1969 Vol. 163, No. 3868

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

#### In hope of doing each other some good

Some scientific people should never leave the campus for too long. The house of learning needs them and only there can they flourish. To try luring them away is a disservice to all.

Other scientific people—no worse scientists—may wish they felt that way but really don't. Those are the ones we must convince of the satisfactions in a scientific career that results, quite indirectly often, in goods and services that one's fellow men want and need. We invite them to our laboratories in Rochester, N.Y. or Kingsport, Tenn. to talk in great detail, not forgetting to mention the differences from academic life.

Perhaps you would care to initiate such dialogue with a note to Dr. D. B. Glass, Eastman Kodak Company, Rochester, N.Y. 14650. We are an equal-opportunity employer.

#### Salt-rejecting membranes

Osmosis isn't as simple as the ninthgrade teacher claimed. No explanation is currently available as to why the above unnatural membranes — which are cellulose acetate and quite nonionic in character—are as good as they are at rejecting salt. No explanation is available, but the membranes themselves are available in three types, along with a fourth that rejects no salt but does reject solutes of molecular weight above 300.

We start with a package deal for \$25. The package contains three 8 x 10-inch sheets of each of the four types.

One of the types, when fed 0.5% NaCl solution at 600 psi and 80F, rejects about 97% of the salt in passing about 20 gal/day/ft². The second type rejects 89% from 34 gal/day/ft². Both of these types come wet in our package, each type separately sealed in polyethylene. We mark the active side—the side bearing the mysterious one-micron-thick layer that must face the feed stock. If you let them dry, give up hope that rewetting will restore them.

NaCl seems to represent the tough case. When working with something easier and you want more flux, the third type comes untempered to let you set the parameter yourself. Yours in any case is the problem of providing a support for the membrane to withstand operating pressures of 600 to 1500 psi and still permit flow of product water to your collecting system. Don't let pH exceed 8.0.

If your experiments with the samples should lead on to a need for larger quantities, watch our \$3.75/ft<sup>2</sup> price plunge with your first sizable order. Most of the 30 or so companies believed currently busy developing equipment for what is being called "reverse osmosis" seem to be glad we are going to offer the membrane. Now they can concentrate their own efforts on equipment to put it in. Thus will go forward the great endeavor to squeeze good water out of bad water, brackish water, sea water, radioactivity-contaminated water, or water carrying other things in solution. And some will care more about the solutes being concentrated than about the purity of what comes out.

Enter purchase order to Eastman Chemical Products, Inc. (Subsidiary of Eastman Kodak Company), Kingsport, Tenn. 37662 for "Sample Kit of Eastman Membrane." Bibliography will be shipped with order. Good luck!

Price subject to change without notice.

#### A bit of aerial film

We have said much about aerial photography for scientific purposes and little about the minimum quantities in which our aerial film products are sold. The minimums may have been big enough to sink many a small scientific project before it ever got off the ground. Now we can report that even a single 100-foot roll of any of the following 70mm aerial films can be ordered for quick delivery from almost any camera shop:

- KODAK EKTACHROME AERO Film 8442, for color transparencies from higher altitudes,
- KODAK EKTACHROME MS AEROGRAPHIC Film 2448, with less contrast and therefore for low altitude; capable of being processed either to a transparency or to a negative that can be printed either as black-and-white or color, without the blanket orange that masks complementaries; tolerating more exposure error because of the chance for correction in the printing.
- KODAK EKTACHROME Infrared Aero Film 8443, the well-known "false color" film that extends color sensation to the near infrared.
- KODAK PLUS-X AERECON Film 8401, for plain black-and-white.

We offer no processing service for these films but can furnish names of firms who do. Write Eastman Kodak Company, Industrial Photo Methods, Rochester, N.Y. 14650.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

#### COVER

Freeze-etching of the outer cell wall surface of a marine strain of *Nitro-somonas*. The large subunits, measuring approximately 150 angstroms, are believed to be composed primarily of structural protein. See page 685. [S. W. Watson and C. C. Remsen, Woods Hole Oceanographic Institution, Woods Hole, Massachusetts]

# Wouldn't it be great if someone designed a 160 g top-loader with 1 mg accuracy and all-digital readout?

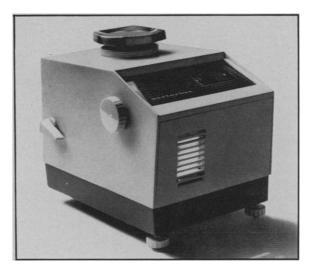

# Someone has. Sartorius.

There are other top-loading balances with 160g capacity, but none is as accurate and easy to read as the new Sartorius 2255... and none is as stable.

To eliminate interpolation error with 'between the line' results, the Model 2255 provides all-digital readout to 1 mg. To further insure accuracy, there is absolutely no discernible swing—this balance stays at the indicated weight. There's no need to squint, either. Its huge new optical scale is a pleasure to read, even under the most adverse lighting conditions.

At only \$725, the above features alone would make the 2255 a great buy, but there are more. The Taramatic® single knob taring system and below-balance weighing accessories are included at no extra cost.

For research, quality control, student use, or any other application requiring 1 mg weighing accuracy at loads up to 160g, this is

the simplest, yet most advanced top-loading balance available.

Sartorius all-digital top-loaders also come with higher capacities. Our 40-page catalog describes them all. For your copy, just write: Sartorius Division, Brinkmann Instruments, Cantiague Road, Westbury, N.Y. 11590.

#### Beings from Outer Space—Corporeal and Spiritual

Since World War II, concern with UFO's from outer space, controlled by intelligent beings, bears much resemblance to concern with the so-called physical phenomena of psychic research after World War I. Spiritualistic mediums claimed they could produce movements of objects by supernormal forces, including the production of ectoplasmic emanations from their bodies. Today this nonsense is pretty much forgotten but these manifestations reverberated in the press during the 1920's and 1930's and were regarded by many as proof of communication with beings from another world in the form of spirits of deceased persons. Belief in this sort of thing involved many professional people including some distinguished scientists, clergymen, physicians, writers, and men of affairs, and the psychic research societies published numerous supporting papers of a pseudoscientific nature.

A famous case was that of a Boston medium in the 1920's, who had a wide following. She was the wife of an eminent surgeon and claimed communication with her dead brother. The old Scientific American magazine had offered a prize of \$5000 to anyone who could demonstrate supernormal physical phenomena to a committee of its choosing. At her request, she was investigated in 1924 by this committee, composed of several Harvard and M.I.T. professors along with Harry Houdini, the magician. The committee reported that evidence for her supernormal powers was inconclusive, although Houdini denounced her as fraudulent. Following wide press publicity, a group at Harvard, of which I was one, later investigated her in a series of seances in the psychological laboratories and found not only that the phenomena were due to trickery, but also how the tricks were done. Our findings, published in an article by me in the Atlantic Monthly of November 1925, resulted in violent recriminations and denunciations of us in published pamphlets and press statements by her followers. Our exposure enhanced her publicity, and she gained more adherents. She was skillful in modifying her mode of operation, depending upon the gullibility of her audience and other circumstances. On several subsequent occasions she was also exposed by other scientists, but at no time until her death did she lose a diminishing circle of devoted believers.

The basic difficulty inherent in any investigation of phenomena such as those of psychic research or of UFO's is that it is impossible for science ever to prove a universal negative. There will be cases which remain unexplained because of lack of data, lack of repeatability, false reporting, wishful thinking, deluded observers, rumors, lies, and fraud. A residue of unexplained cases is not a justification for continuing an investigation after overwhelming evidence has disposed of hypotheses of supernormality, such as beings from outer space or communications from the dead. Unexplained cases are simply unexplained. They can never constitute evidence for any hypothesis. Science deals with probabilities, and the Condon investigation adds massive additional weight to the already overwhelming improbability of visits by UFO's guided by intelligent beings. The Condon report rightly points out that further investigations of UFO's will be wasteful. In time we may expect that UFO visitors from outer space will be forgotten, just as ectoplasm as evidence for communication with the dead is now forgotten. We may also anticipate, however, that many present believers will continue to believe for their own psychological reasons, which have nothing to do with science and the rules of evidence.—Hudson Hoagland, President Emeritus, Worcester Foundation for Experimental Biology, and Member, AAAS Board of Directors

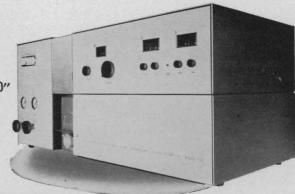

# THIS IS A LIST OF OPTIONS YOU WON'T NEED (THEY'RE BUILT-IN)

- \*Dual channel double beam
  Digital concentration readout (2)
  True mathematical integrator
  Recorder and computer outputs
- \*Push-button automatic zero control
- \*Servo-automatic recalibration
- \*Reads 2 elements simultaneously, or Read one element w/internal standard Push-button fail-safe flame ignition Gas control system (3 gases)
- \*Push-button fail-safe N20 conversion
- \*Gas and flame safety monitor
- \*Simplified hollow cathode zone balance (2) Six tube hollow cathode turret
- \*Preset independent hollow cathode current Curved slits on monochromator Constant head drain system Flame emission capability
- \*All solid-state modular electronics Stabilized voltage regulation
- \*External electronic test circuit
  Single, integrated package 18" x 40" x 20"

\*Exclusive features

## THIS IS A LIST OF OPTIONS YOU CAN ORDER SEPARATELY

Nitrous oxide burner
Total consumption burner
UV-Vis spectrophotometer attachment
Recorder (if needed)

# ATOMIC ABSORPTION WITH THE OPTIONAL EXTRAS LEFT IN!

Add up the "optional extras" that are really necessary for safe, easy, dependable and precise analysis by atomic absorption. Then write for further information about the Model 153.
