Index Issue

No matter what your amino acid analysis requirements, there is a Beckman Analyzer to fit them. If you do lots of analyses, choose the Model 121. It runs day and night—can inject and analyze 72 samples (36 complete 2-column analyses) automatically, without attention.

If your work load is lighter, consider the new fully automatic, low-cost Model 117.

If you don't need full automation, choose the semi-automatic Model 120C, long the world standard for quality and performance.

Or, for the modest budget, there is the Model 116. It gets you off to a good start, and lets you add analytical finesse as you go along.

All four Analyzers give the same superb resolution and repeatability. And all are backed by our nationwide force of Field Service Engineers who know methodologies as well as instrumentation. For more information, write Spinco Division, Beckman Instruments, Inc. 1117 California Avenue, Palo Alto, California 94304. Ask for Data File AAA.

Talk about Amino Acid Analyzers. Beckman has four to choose from!

Beckman®
INSTRUMENTS, INC.

Announcing the Brush 440

If it doesn't meet
your portable recording needs,
maybe you don't need a
portable recorder.

It's tough to imagine a general purpose portable that could do more.

The Brush 440 has four 40mm channels, two event markers and a push-button choice of eight chart speeds. We guarantee trace linearity of 99.5%. Or better. And our stringless, springless servo system enforces pen position clear across the channel.

The traces are something else: clear,

crisp, uniform. Pressurized ink-writing puts them *into* the paper not onto it. There's no smudge, no smear, no puddling. A disposable ink cartridge holds up to a year's supply and can be replaced in seconds with no mess, no fuss.

There's more. Such as a wide choice of preamps that offer measurement ranges from $1\mu\text{V}$ per division to 500 V

full scale. Frequency response that's flat within $\pm 2\%$ of full scale from d-c to 40 Hz. And typically handsome cabinetry and rugged construction.

Look it over. Check it out. Add it up. And you'll see why this brand new 45 pounder is the ideal way to monitor such dynamic variables as temperature, pressure, strain, vibration or what have you. Ask your Brush representative for a demonstration. Or

write for details. Brush Instruments Division, Gould Inc., 3631 Perkins Avenue, Cleveland, Ohio 44114 or Rue Van Boeckel #38, Brussels 14, Belgium.

COVER

View of Washington Cathedral taken from the west end of the nave and showing the deviation of about 2 degrees of the nave axis from the axis of the choir at the east end. The architect intentionally designed this deviation, one of many in the cathedral, to enhance the visual effect. See letter by R. T. Feller, page 1669. [Gary Laurish Photography, Washington, D.C.]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

GRADIENT FORMER

The ISCO Model 570 is a fully automatic instrument for forming sucrose, CsCl, or other density gradients used in density gradient ultracentrifugation and electrophoresis. Convex, concave, linear, and exponential gradients from 3 to 80 ml can be programmed without cutting any cams. All gradients are identical and faithful reproductions of the desired curve.

Centrifuge tubes are held in a rotating reel and are sequentially filled with a preselected gradient without any attention from the operator. You can set it up in the afternoon and have 22 perfect gradients waiting in the morning.

For further information
ask for brochure GF37.

institutes and universities after the symposium. The problems that Nussenzveig discusses are so severe and pervasive that they were visible even in my brief "outsider's" view.

Among the most discouraging things I saw were some nuclear particle accelerators, which were "gifts" from the United States. Such machines are given away because they are no longer capable of doing "competitive" research. The "gift" of such a machine appears to require of the recipient enormous expense (money for a building and installation costs) and effort (physicists, not engineers, must struggle under the conditions discussed in the article to get the machine running). After years of such struggle, the machine may be in operation, but the financial support for the "auxiliary" facilities—the counters, on-line computers, beam handling systems, and so forth, which now seem to cost about as much as the machine itself—is almost nonexistent. Under these conditions the laboratory is essentially useless for either research or training of graduate students, and the effort and expense have been wasted. This situation is hinted at by Nussenzveig, but I believe the problem should be strongly emphasized.

On the other hand, the *Instituto Venezolano de Investigaciones Científicas* (outside Caracas) appeared to be relatively well off with respect to level and continuity of financial support and lack of government interference in its operations. The quality of the support is probably due in part to the relative wealth of the country as compared to its neighbors; and the lack of political intrusions is at least partly due to the geographic and organizational separation between the Institute and the large University in Caracas. Regardless of the reasons, though, this Institute has a reasonably supported, well-staffed, and well-motivated research program.

RICHARD L. COHEN
*Bell Telephone Laboratories,
Murray Hill, New Jersey 07974*

Man's First Route to America

In "The earliest Americans" (7 Nov., p. 709), Haynes says, "Theories of the initial peopling of the New World are intimately related to sea level and glaciation during the late Pleistocene, because it is generally agreed that man passed from the Old to the New World by way

of an emerged Bering platform [my italics] and thence through central Canada."

The Bermuda platform is tectonically stable and offers a potential reference section for Quaternary sea-level changes. Precise carbon-14 dates are now available and it appears that 37,000 years ago the Wisconsin-Illinois interglacial was at its climatic optimum, with, however, sea level at or slightly below present sea level. I submit that this, rather than at the height of the subsequent glaciation, was the most likely time for early man to have crossed from the Old to the New World, by island-hopping along the Kuril-Kamchatka-Commander-Aleutian chain or directly from the Chukchi Peninsula to the Seward Peninsula. The presence of early man in Northeast Asia during climatic optimum is much more likely than his presence at the height of a glaciation, when even today the southern limit of permafrost lies around 50°N in eastern Siberia, and conditions under a glacial regime must have been much worse.

As to whether such sea journeys were possible for early man, the initial entry into Australia by the ancestral Aboriginal group or groups is now placed at 30,000 years ago or earlier when sea level was little if any lower than at present, and man obviously came by boat as witnessed by the absence of large placentals, other than the dog, in Australia.

R. POCKLINGTON
*Bermuda Biological Station for
Research, St. George's West, Bermuda*

There is no evidence to preclude the speculations of Pocklington (and others as well). While some immigrants may indeed have taken such a route via boat, I and others, for lack of evidence to the contrary, believe that most (but not necessarily all) of the peopling of the New World took place by normal processes of human population expansion and diffusion across continental land masses such as Beringia during glacial periods because (i) there was paleolithic occupation of northern Siberia during the last glacial period; (ii) there was then an emergent Bering platform; (iii) large land mammals walked across this platform; and (iv) Paleo-Indian hunters followed game herds (1). Only future work will lead to a better understanding of the relative importance of population dispersal models for Paleo-Indian occupation of America.

The sea-level data present no conflict in that I believe in the Mid-Wisconsin high stand of sea level reported by others (1). The only difference of opinion here is that 37,000 years ago is a Mid-Wisconsin date and not that of the Wisconsin-Illinoian interglacial (Sangamon).

Shift of NSF Funds

In a report entitled "Toward a Public Policy for Graduate Education in the Sciences" (1), the National Science Board has made a number of official recommendations for changes in the "mechanisms of federal support" of research and graduate education. The most novel and controversial of these is to shift a large portion of the funds currently allocated by the National Science Foundation for the support of scientific research through many individual research contracts and grants to the funding of a much smaller number of large "institutional sustaining grants" to be administered by the various universities. Just what portion of NSF expenditures is to be devoted to such institutional grants is unclear except that it will be a very significant fraction of the current \$400 million budget.

We believe this proposed changeover to institutional grants is not in the public interest. First, if the decision to allot the grants is left to the university administrations, research will receive less total funding than at present. Administrations are apt to be overresponsive to current student demands for more undergraduate teaching and less research and graduate education by the faculty. Moreover, they are under steady pressure to increase the financial support of undergraduate students. Second, an important purpose of graduate education is to bring the student up to the prevailing frontiers of knowledge, and this is inconceivable without a faculty steeped in active research. Peaceful periods of sustained activity free from interruptions, such as the summer vacation, are necessary to do this research. Any plan which reduces support for research, especially summer research, will be detrimental.

Third, the system of "institutional sustaining grants" will create interdepartmental problems with regard to the sound apportionment of funds between individual members within departments. As it is, the universities and their departments are overburdened by questions of judgment and comparison of the relative merits of their faculty members. To this very time-consuming task would now be added the arduous one of evaluating individual research projects. Whatever arbitrary formula is followed, it will be less objective and fair than the present refereeing and reviewing system employed by the NSF, Office of Naval Research, and other research funding agencies. For instance, it might be decided to divide the funds allocated to mathematics uniformly over the whole department, giving summer research support to all who want it. This would lower the summer stipend below the two-ninths of the academic year salary which the NSF allows. Quality would suffer and mediocrity would be encouraged instead of a premium being placed on important projects. Reduced summer salaries would discourage young mathematicians who would interpret it as a sign of lowered priorities for research. Contrary to the opinion of many administrators, the hope of financial compensation cannot be dismissed as an incentive for stimulating good research. One need only contrast the weak position of research in most American universities of the pre-World War II period with the situation today to measure the importance of a national policy of sustained and direct financial support for individual research.

For these reasons we believe that the plan proposed by the NSB will create more problems than it will solve and will be inferior to the existing system which is working relatively well. If changes are necessary, then why not retain the existing system for funding the projects of the senior faculty, and support the research efforts of younger faculty members through departmental rather than institutional grants?

The Next Industrial Revolution

We must have a new industrial revolution even if a few of us have to generate it. Other industrial revolutions have come about unplanned. The first was hailed as a way of ennobling human beings by substituting steam and electrical power for their muscles. This it undoubtedly did, but the generation of power brought with it side effects—including air pollution—which, far from being ennobling, were and continue to be degrading to human existence. In the second revolution the multiplication of "things" came about—"things" that at last could be mass-produced, so that people could have more and more of them. Thus was generated the solid-waste problem.

A third revolution was the tremendous growth in industrial chemistry, and the ability to tailor-make chemicals in vast quantities very cheaply, for all kinds of purposes—for example, pesticides intended to selectively destroy forms of life inimical to various groups of human beings. But these turned out not to be so selective; they have upset the little-understood ecological balance, and have polluted and poisoned the waters.

In preparation for the next industrial revolution, I suggest that we revise our vocabulary. For instance, there is no such thing, no such person, as a consumer. We merely *use* "things"; and, according to the law of the conservation of matter, exactly the same mass of material is discarded after use. Thus, as the standard of living goes up, the amount of waste and consequent pollution must go up.

I believe we must base the next industrial revolution—a planned one—on the thesis that there is no such thing as waste, that waste is simply some useful substance that we do not yet have the wit to use. Industry so far is doing only half its job. It performs magnificent feats of scientific, technological, and managerial skill to take things from the land, refine them, and mass-manufacture, mass-market, and mass-distribute them to the so-called consumer; then the same mass of material is left, after use, to the so-called public sector, to be "disposed of." By and large, in our society, the private sector makes the things *before* use and the public sector disposes of them *after* use.

In the next industrial revolution, there must be a loop back from the user to the factory, which industry must close. If American industrial genius can mass-assemble and mass-distribute, why cannot the same genius mass-collect, mass-disassemble, and massively reuse the materials? If American industry should take upon itself the task of closing this loop, then its original design of the articles would include features facilitating their return and remaking. If, on the other hand, we continue to have the private sector make things and the public sector dispose of them, designs for reuse will not easily come about.

We industrial revolutionaries must plan to move more and more into the fields of human service, and not leave such concerns to the so-called public sector. We have seen our food supply grow to abundance in the United States, with fewer and fewer people needed to grow it. We are seeing the automation of factories, with an abundance of "things" provided by fewer and fewer people. On the other hand, we have a shortage of human services and a shortage of people providing these services. It follows quite simply that, if private enterprise is not to dwindle, while the public sector grows to be an all-embracing octopus, then private enterprise must go into the fields of human service.

The next industrial revolution is on our doorstep. Let us be the revolutionaries who shape it, rather than have it happen—and shape us. —ATHELSTAN SPILHAUS, *president, American Association for the Advancement of Science*

This editorial is adapted from a lecture presented at a recent National Industry Conference Board conference on Management and Man in the Computer Age, held in New York. The complete text appeared in the February 1970 issue of *The Conference Board Record*.

A complete anatomy and physiology program for your students
New 2nd Edition

Jacob & Francone: STRUCTURE AND FUNCTION IN MAN

By STANLEY W. JACOB, M.D., Univ. of Oregon Medical School; and CLARICE ASHWORTH FRANCONI, formerly of Univ. of Oregon Medical School.

Widely used in introductory courses that combine anatomy and physiology, this lavishly illustrated text has been revised and updated in a *New 2nd Edition*. To make a complete, well-rounded teaching program for students in the health sciences, an accompanying laboratory manual and a new set of audiovisual teaching aids are available.

The text now includes new tables of muscles; new sections on genetic biology, cancer, carbohydrate and fat digestion, and contraceptives; and many new references and drawings. A Teacher's Guide provides references and an annotated list of films for classroom use.

About 570 pp. About 470 figs. About \$8.75. Ready April, 1970. Audiovisual teaching aids: 10 35mm filmstrips of about 60 frames each, each accompanied by a 15-20 minute narration on a long playing record and a printed script of the narration. May be projected in the classroom or used by individual students in a desktop viewer. Set of 10 filmstrips with records and scripts, about \$150. Individual filmstrips with records and scripts, about \$15. Also available with narration on tape.

Tailored to the needs of today's students
New 2nd Edition

Leeson & Leeson: HISTOLOGY

By C. ROLAND LEESON, M.D., Univ. of Missouri School of Medicine; and THOMAS S. LEESON, M.D., Univ. of Alberta Faculty of Medicine.

Here is an up-to-date revision of a text that succinctly covers the three major divisions of microanatomy: cell biology, basic tissues and systematic histology. For this edition the authors have added many new illustrations including photomicrographs of Epon-embedded sections. Other new material includes: discussions of such organelles as annulate lamellae and microtubules—descriptions of freeze-etch and scanning microscopy—current information on lymphocytes and on muscle contractions and protein secretion.

In the first part of the book, the authors cover the cell, intercellular substances, and the four primary tissues and their specializations. The second section is devoted to histologic illumination of each organ system.

Two filmstrips of 100 full-color photomicrographs keyed to the text are available as an excellent teaching aid.

525 pp. 490 figs. \$11. Jan., 1970. Also available: Two 35mm. filmstrips totalling 100 full-color photomicrographs keyed to the text. Desktop viewer and filmstrips, \$35. Filmstrips separately, \$15.

New Editions of Established Texts ... plus Audiovisual Teaching Aids

An internationally recognized introductory text of embryology
New 3rd Edition

Balinsky: AN INTRODUCTION TO EMBRYOLOGY

By B. I. BALINSKY, Dr. Biol. Sci., Univ. of the Witwatersrand, Johannesburg, South Africa.

Now in a *New 3rd Edition*, this valuable text covers comparative vertebrate embryology at the undergraduate level. Dr. Balinsky, a well known authority in the field, shows the embryonic development of vertebrates by processes and by the development of organ systems. Embryology is interpreted broadly as dealing with ontogenetic development of animals. The author therefore includes such topics as regeneration, metamorphosis and asexual reproduction.

This *New 3rd Edition* covers recent breakthroughs and advances in this field. Significant new information is included on genetic control of development, the processes of differentiation, and advances in deciphering the genetic code. The nomenclature used has been revised to conform to the recommendations of the 1970 International Anatomical Nomenclature Committee.

About 750 pp. About 455 figs. About \$10. Ready April, 1970.

A comparative study and history of vertebrates
New 4th Edition

Romer: THE VERTEBRATE BODY

By ALFRED SHERWOOD ROMER, Museum of Comparative Zoology, Harvard Univ.

This popular text, now in a *New 4th Edition*, is one of the finest volumes available for a background course in comparative anatomy. A study of the form and function of the vertebrate body is interwoven with embryological, histological, paleontological and evolutionary material. In this edition, coverage is truly comparative and does not overemphasize human structure. Function is considered so that the student may understand the relations of the various systems within the animal in relation to its environment.

Embryology is presented in a manner which creates an understanding of homology and shows the student the important place of the time element in various stages of vertebrate development.

The use of many full-color illustrations enhances the visual impact of the text, particularly in interpreting nerve components and blood vessels.

About 640 pp. About 415 figs. About \$10.50. Just Ready.

Instructions for Contributors

The Editors of *Science*

Manuscripts submitted to *Science* for consideration for publication can be handled expeditiously if they are prepared in the form described in these instructions.

Submit an original and two duplicates of each manuscript. With the manuscript send a letter of transmittal giving (i) the name(s) of the author(s); (ii) the title of the paper and a one- or two-sentence statement of its main point; (iii) the name, address, and field of interest of 4 to 6 persons outside your institution who you think are qualified to act as referees for your paper; (iv) the field(s) of interest of readers who you anticipate will wish to read your paper.

Editorial Policies

All papers submitted are considered for publication. The author's membership or lack of membership in the AAAS is not a factor in selection. Papers are accepted with the understanding that they have not been published, submitted, or accepted for publication elsewhere. Authors will usually be notified of acceptance, rejection, or need for revision in 4 to 6 weeks (Reports) or 6 to 10 weeks (Articles).

Types of papers. Five types of signed papers are published: Articles, Reports, Letters, Technical Comments, and Book Reviews. Familiarize yourself with the general form of the type of paper you wish to submit by looking over a recent issue of the journal, and then follow the instructions for that type of paper.

Reviews. Almost all Articles, Reports, and Technical Comments, whether solicited or not, are sent to two or more outside referees for evaluation of their significance and soundness. Forms showing some of the criteria reviewers are expected to consider are available on request.

Editing. Papers are edited to improve the effectiveness of communication between the author and his readers. The most important goal is to eliminate ambiguities. In addition, improvement

of sentence structure often permits readers to absorb salient ideas quickly. When editing is extensive, with consequent danger of altered meanings, papers are returned to the author for correction and approval before type is set. Authors are free to make additional changes at this stage.

Proofs. One set of galley proofs or an equivalent is provided for each paper. Keep alterations to a minimum, and mark them only on the galley, not on the manuscript. Extensive alterations may delay publication by 2 to 4 weeks.

Reprints. An order blank for reprints accompanies proofs.

Writing Papers

Organize your material carefully, putting the news of your finding or a statement of the problem first, supporting details and arguments second. Make sure that the significance of your work will be apparent to readers outside your field, even if you feel you are explaining too much to your colleagues. Present each step in terms of the purpose it serves in supporting your finding or solving the problem. Avoid chronological steps, for the purpose of the steps may not be clear to the reader until he finishes reading the paper.

Provide enough details of method and equipment so that another worker can repeat your work, but omit minute and comprehensive details which are generally known or which can be covered by citation of another paper. Use metric units of measure. If measurements were made in English units, give metric equivalents.

Avoid specialized laboratory jargon and abbreviations, but use technical terms as necessary, defining those likely to be known only in your field. Readers will skip a paper they do not understand. They should not be expected to consult a technical dictionary.

Choose the active voice more often than you choose the passive, for the

passive voice usually requires more words and often obscures the agent of action. Use first person, not third; do not use first person plural when singular is appropriate. Use a good general style manual, not a specialty style manual. The University of Chicago style manual, the style manual of the American Institute of Physics, and the *Style Manual for Biological Journals*, among others, are appropriate.

Manuscripts

Prepare your manuscript in the form used by *Science*. Use bond paper for the first copy. Submit two duplicates. Double-space title, abstracts, text, signature, address, references (including the lines of a single reference), figure legends, and tables (including titles, columns, headings, body, and footnotes). Do not use single spacing anywhere. Put the name of the first author and the page number in the upper right-hand corner of every page.

Paging. Use a separate page for the title; number it page 1. Begin each major section—text, references and notes, and figure legends—on a new sheet. Put each table on a separate sheet. Place figure legends and tables after the references.

Title. Begin the title with a word useful in indexing and information retrieval (not "Effect" or "New").

References and Notes. Number all references to the literature, footnotes, and acknowledgments in a single sequence in the order in which they are cited in the text. Gather all acknowledgments into a single citation, and keep them short ("I thank," not "I wish to thank"). Cite all references and notes but do not cite them in titles or abstracts. Cite several under one number when feasible. Use *Chemical Abstracts List of Periodicals* for abbreviations of journal names. If the journal is not listed there, provide the full name. Use the following forms:

Journal: H. Smith, *Amer. J. Physiol.* **98**, 279 (1931).

Book: F. Dacheille and R. Roy, *Modern Very High Pressure Techniques* (Butterworth, London, 1961), pp. 163–180.

Chapter: F. Dacheille and R. Roy, in *Reactivity of Solids*, J. H. De Boer, Ed. (Elsevier, Amsterdam, 1960), p. 502.

Illustrations. Submit three copies of each diagram, graph, map, or photograph. Cite all illustrations in the text and provide a brief legend, to be set in type, for each. Do not combine line

drawings and photographs in one illustration. Do not incorporate the legend in the figure itself. Use India ink and heavy white paper or blue-lined coordinate paper for line drawings and graphs. Use heavier lines for curves than you use for the axes. Place labels parallel to the axes, using capital and lower-case letters; put units of measurement in parentheses after the label—for example, Time (sec). Plan your figures for the smallest possible printed size consistent with clarity.

Photographs should have a glossy finish, with sharp contrast between black and white areas. Indicate magnification with a scale line on the photograph.

Tables. Type each table on a separate sheet, number it with an arabic numeral, give it a title, and cite it in the text. Double space throughout. Give each column a heading. Indicate units of measure in parentheses in the heading for each column. Do not change the unit of measure within a column. Do not use vertical rules. Do not use horizontal rules other than those in the heading and at the bottom. A column containing data readily calculated from data given in other columns can usually be omitted; if such a column provides essential data, the columns containing the other data can usually be omitted.

Plan your table for small size. A one-column table may be up to 42 characters wide. Count characters by counting the widest entry in each table column (whether in the body or the heading) and allow three characters for spaces between table columns. A two-column table may be 90 characters wide.

Equations and formulas. Use quadruple spacing around all equations and formulas that are to be set off from the text. Most should be set off. Start them at the left margin. Use the solidus for simple fractions, adding the necessary parentheses. But if braces and brackets are required, use built-up fractions. Identify handwritten symbols in the margin, and give the meanings of all symbols and variables in the text immediately after the equation.

Articles

Articles, both solicited and unsolicited, may range in length from 2000 to 5000 words (up to 20 manuscript pages). Write them clearly in reason-

ably nontechnical language. Provide a title of one or two lines of up to 26 characters per line and a subtitle consisting of a complete sentence in two lines with a character count between 95 and 105 for the sentence (spaces between words count as one character each). Do not break words at the ends of lines. Write a brief author note, giving your position and address. Do not include acknowledgments. Place title, subtitle, and author note on page 1. Begin the text on page 2.

Insert subheads at appropriate places in the text, averaging about one subhead for each 3 manuscript pages. Keep them short—up to 35 characters and spaces. Do not use more than one degree or level of subheads.

Provide a summary at the end.

Do not submit more than one illustration (table or figure) for each 4 manuscript pages unless you have planned carefully for grouping. With such planning, many illustrations can be accommodated in the article. Consult the editorial office for help in planning.

Reports

Short reports of current research results may vary in length from 1 to 6 double-spaced manuscript pages of text. The shorter papers receive preferred treatment. Limit illustrative material (both tables and figures) to one item for each 3 manuscript pages. Three items is the maximum. A research report should have news value for the scientific community or be of unusual interest to the specialist or of broad interest because of its interdisciplinary nature. It should contain solid research results or reliable theoretical calculations. Speculation should be limited and is permissible only when accompanied by solid work.

Title. Begin the title with an important word (preferably a noun) that is likely to be useful to indexers. The title may be a conventional one (composed primarily of nouns and adjectives), a sentence (containing a verb) or a structure with a colon (Nictitating Membrane: Classical Conditioning and Extinction in the Albino Rabbit). Limit it to three lines of complete words of no more than 32 characters per line (spaces between words count as one character each). Do not use abbreviations. Type the title in the middle of page 1.

Abstract. Provide an abstract of 45

to 55 words on page 2. The abstract should amplify the title but should not repeat it or phrases in it. Qualifying words for terms used in the title may be used. Tell the results of the work, but not in terms such as “——— was found,” “is described,” or “is presented.”

Text. Begin the text on page 3. Put the news first. Do not refer to unpublished work or discuss your plans for further work. If your paper is a short report of work covered in a longer paper to be published in a specialty journal, you may refer to this paper if it has been accepted. Name the journal. If the manuscript has not been accepted, refer to it as “in preparation.” Omit references to private communications. Do not use subheads.

Signature. List the authors on the last page of the text and give a simple mailing address.

Received dates. Each report will be dated the day an acceptable version is received in the editorial office.

Letters

The Letters section provides a forum for discussion of matters of general interest to scientists. Letters are judged only on clarity of expression and interest. Keep them short and to the point; the preferred length is 250 words. The editors frequently shorten letters.

Technical Comments

Letters concerning technical papers in *Science* are published as Technical Comments at the end of the Reports section. They may add information or point out deficiencies. Reviews are obtained before acceptance.

Book Reviews

The selection of books to be reviewed is made by the editors with the help of advisers in the various specialties; arrangements are then made with reviewers. A sheet of instructions accompanies each book when it is sent to the reviewer.

Cover Photographs

Particularly good photographs suitable for use on the cover are desired.
