The Egyptians Worked Harder than LKB

Making Pyramids

THE PYRAMITOME is LKB's Pyramid Maker. It's a microtome as well. This latest addition to the Ultramicrotomy Laboratory offers the simplest and most effective solution to the shaping of specimen blocks.

The use of glass knives not only provides the specimen blocks with absolutely parallel and mirror-smooth facets, but also prevents dust contamination during pyramid shaping.

Without relocating the specimen it is possible to cut large survey sections in straight ribbons, free from "fringed edges", that are easily collected from the surface of the trough liquid.

An LKB Pyramitome in your laboratory releases the Ultratome for finer and more precise operations.

Write to the address above for our illustrated brochure.

Sales and service in USA: New York, Boston, Washington, Chicago, St. Louis, Atlanta, Houston, Los Angeles; in Europe: Stockholm, The Hague, Copenhagen, Rome, Vienna, London; and throughout the world.

Equip your lab from the 1970 Nalgene Labware Catalog. 44 pages of illustrations, prices and specifications for more than 180 different products. Every one designed for a specific laboratory application and precision-molded from the proper resin. Every one unbreakable, easy to handle, and easy to clean. The most complete line of plastics products for the laboratory.

Nalgene Graduates and Beakers. Transparent, autoclavable TPX, and durable polypropylene. All with easy-to-read graduations. 10-4000 ml.

Nalgene Laboratory Bottles and Carboys. Over 30 styles for every laboratory application. Leakproof, cylindrical, rectangular, square. With and without handles, spigots, tubulation. Many autoclavable. Polypropylene, polyethylene, PVC, Teflon® FEP, polycarbonate. New spigot for leakproof performance. 1 oz.-13 gal.

Nalgene Pipet Cleaning Equipment. Efficient washer-rinser can't back siphon, has a wide range of speeds and cycles. Pipet jars and baskets are also unbreakable, easy to handle, and resistant to cleaning solutions.

Nalgene Wash Bottles. With new screw closure that makes this universal favorite even more convenient. Polyethylene and Teflon FEP. 30-1000 ml.

New for 1970

Nalgene Labware... better all the time! New designs, new resins and new products continue to make plastics a universal labware material.

150mm Desiccator. New, personal-sized unit. Unbreakable, priced so every bench chemist or student can have his own.

Rectangular Bottles. Saves up to 1/3 in shelf space. Linear polyethylene. 4-32 oz.

Fernbach Culture Flask. 2800 ml capacity provides needed surface area for cultures. Unbreakable, transparent polycarbonate. Autoclavable.

Drop Dispenser Bottle. Always dispenses just one drop at a time. Polyethylene. 15-250 ml.

Unitary Dropping Bottles. New design, delivers only drops at a time, never a stream—no matter how hard you squeeze. Leakproof screw closures. Polyethylene, 125 and 250 ml.

Evaporating and Titrating Dish. 100mm x 42mm, approximate brim capacity, 175 ml. Resists fluoride solutions and HF, can be safely used with infrared heat up to 135° C for evaporations. Polypropylene. Opaque white color provides excellent background for color titrations.

Your best laboratory tool...

Nalgene Labware... better all the time.

Order Nalgene® Labware from our new Catalog. For your free copy, ask your laboratory supply dealer. Or, write Dept. 85171, Nalgene Labware Division, Nalge Company, Rochester, N.Y. 14602.

COVER

Conjoined pair of leopard frogs (*Rana pipiens*) that had been united in parabiosis in early embryonic development (60 hours after fertilization). The co-partners are blood cell chimeras and are immunologically tolerant of each other's blood antigens. See page 850. [E. Peter Volpe and Elizabeth M. Earley, Tulane University]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

The 2420 Tri-Carb® Spectrometer ...a totally new concept in liquid scintillation sample handling and counting

ELIMINATES ONE-BY-ONE TRANSFER OF SAMPLES

Counting vials for the 2420 are packed in 50-vial, disposable Servo-Trays™ (shown above) that function as both shipping containers and sample trays. They are delivered ready to use, enclosed in protective polyethylene blister packs. The user fills the vials with scintillator solution and sample, attaches caps, and places the Servo-Trays into the instrument for counting. An automatic, multiple pipetter is available for high speed filling of vials in Servo-Trays. When counting is completed, Servo-Trays may be disposed of as desired. Sample vials need never be removed from the trays, and one-by-one sample handling is completely eliminated.

SIMPLE TO OPERATE

Only three push buttons are required for day-to-day operation of the instrument. Six sets of preset counting conditions automatically establish optimum discriminator and amplifier settings for commonly-counted nuclides in either single or double-labeled samples. An on-line electronic computer processes the data.

The 2420 Tri-Carb Spectrometer was designed for maximum user convenience—from sample preparation to data reduction and print-out. For complete information on this new system see your Packard Sales Engineer or write for Bulletin 1117U.

Concepts from Union Carbide:

Cryogenic freezing of red blood cells

Probably no single problem has received more attention from cryobiologists than the preservation of the human red cell. And with good reason. Procedures that extend the supply of erythrocytes for transfusion have meaning in terms of human lives.

The prospect of a frozen blood reserve has been a matter of intensive interest to the blood banking agencies for the past twenty years: some have played a major role in the scientific attack on the problem. It has not been easy. It was observed in 1941 that red cells (suitably protected with additive substances) could survive the drastic environmental changes induced by freezing. Since then, processes have been sought for the preservation of blood in the frozen state that would provide a useful and acceptable product for transfusion. As evidenced over the past decade by the successful transfusion of thousands of units of blood preserved in the frozen state, that goal seems to have been reached.

The current limitation of twenty-one to twenty-eight days for blood preserved by conventional methods in the liquid state has often taxed the resources of the organizations that undertake to provide our communities with supplies of this indispensable agent. The relatively short shelf life of the cellular components of blood adds to the problem of coordinating supply with demand. The less common blood types sometimes are difficult to procure, but even the more common types may vary in supply at any given time.

Red cell wastage is an inevitable consequence of the dating period necessarily imposed on blood stored at 4°C. A primary objective of agencies interested in preserving blood at low temperatures is to prevent this wastage. Another, of course, is to assure adequate reserves of all types of blood at all times for each community. Conceivably then, as frozen blood banks become established in various parts of the country, an integrated and computerized inventory system could be developed that would result in an effective national reserve.

Several practical approaches to the preservation of blood at low temperatures have evolved. All have some elements in common. A solution of additives, often called cryoprotective agents—glycerol is the outstanding example—is combined with the red cells from which most of the plasma and much of the other cellular components of blood (leukocytes and thrombocytes) have been removed. This is done in special containers in which the erythrocytes are cooled and placed in long-term storage. When needed, the erythrocytes are withdrawn from storage, warmed, and subjected to a washing procedure to remove the protective agent before transfusion.

The heart of a frozen blood reserve is the storage facility. Storage equipment is of two general types: cryogenic and noncryogenic. The latter provides temperatures down to about -85°C and depends on electric power. The cryogenic equipment is independent of a power source and provides lower storage temperatures—down

to -196°C—with liquid nitrogen, the most commonly used refrigerant. Associated with such storage equipment are cryogenic shipping units that permit transport of blood in the frozen state without danger of a destructive rise in temperature that might render the blood cells unfit for transfusion.

Small quantities of blood are instantly frozen for long-term storage in the drop-let freezer. A mechanically vibrated syringe releases droplets into a revolving drum of liquid nitrogen. The frozen droplets are collected in the base. Thousands of droplets can be collected from each sample for use as reference specimens.

The banking of frozen blood with longer shelf life should considerably enhance the ability of the blood supply agencies to meet demand and might influence current procurement practices. The use of cryogenic storage equipment would provide a margin of safety for autologous blood banking in which individuals of rare blood type would establish a reserve of their own blood in anticipation of later need. Probably most important in terms of medical need, the availability of banks of frozen red cells would seem likely to lead to the development of banks of the other cellular components of blood. With current liquid state storage procedures, platelets and leukocytes—far less stable than the red cell—are without transfusion value within about three days or less after donation. At present, the only prospect for establishing a large-scale reserve of these invaluable components is to preserve them in the frozen state. Although low temperature preservation procedures for these cells are not technically as far advanced as for the red cell, several blood laboratories are fully aware of the need and are attacking the problem vigorously.

The refrigerator shown here stores red blood cells for transfusions. No other cryogenic refrigerator provides as much storage capacity in as little space as the LINDE LR-1000.

LINDE cryogenic refrigerators come in all shapes and sizes

Union Carbide Corporation produces a full line of cryogenic refrigerators, dewars, and controlled-rate freezers. These low-temperature liquid nitrogen units can solve your preservation problems. Until recently, blood could only be stored for about twenty-one days. Now, it can be stored for a century or more and, when thawed, be as viable as it was the day it was taken from the donor.

The 3300 is a time sharing mini-computer system for only $\frac{1}{4}$ the cost of subscription services or other in-house time sharing systems. That, in itself, is very therapeutic. And any anxieties about communicating with a computer can be eliminated by BASIC. The popular conversational language, ideal for beginners and experts alike. It's simple to get involved with a 3300. Begin a system with just one terminal if you like. Then add hardware as needed to accommodate up to 16 users, or to broaden system capability. It's truly mind expanding.

 **WANG**
LABORATORIES, INC.

**Until now you couldn't
get power, precision,
low cost and small
size all in one
power supply.**

ISCO has changed all that.

The ISCO Model 490 Power Supply provides either constant current or constant voltage with unusual stability, compactness, and light weight. Any current from 0 to 150 ma can be obtained at any voltage from 0 to 1,000 volts. Constant voltage or constant current output will not vary more than $\pm 0.3\%$ throughout the entire range. RMS ripple and noise are less than .02%. The instrument is completely solid state and is protected against overvoltage, overcurrent, and short circuits.

Strategic Postures

In "Strategic arms talks: What is negotiable?" (27 Mar., p. 1707), Andrew Hamilton mentioned the three negotiating strategies discussed by President Nixon in his foreign policy message on 18 February. Hamilton correctly identified the third as reducing offensive forces, but he added: "It is notable that the President did not mention restrictions on defensive weapons such as the ABM in the third approach. One school of strategists, led by Herman Kahn and Donald Brennan of the Hudson Institute, has for several years advocated a 'defense race' as a more stable form of competition than an offense race."

It is correct that I have been advocating a substantial shift in emphasis to defense, as opposed to offense. . . . But, in associating my views with the President's third strategy, I believe Hamilton read into the strategy an association that was not intended. In the President's message, after he listed the three categories of negotiations (the "strategies"), the paragraph immediately following the third reads: "Each of these options was analyzed in relation to various levels of strategic defensive missiles, ABM's." It is quite clear that this was intended to apply to the third strategy no less than the other two.

I have favored shifting emphasis from offense to defense not so much because it would provide "a more stable form of arms competition than an offense race," indeed there are few senses in which a "more stable" situation would be a likely outcome, but first and foremost because it could save enormous numbers of lives, and save important resources to support the survivors, in the event a war actually occurred. [There are other important reasons as well (1).] I am quite willing that a suitable shift in emphasis should reduce Russian lives at risk no less than American, and I do not intrinsically favor a "defense race" to bring this about.

There has been a major revolution in the technology of active defense in the past 6 or 7 years, and this makes it possible to favor live Americans in preference to dead Russians in the procurement of our strategic forces and in our arms-control objectives. We should encourage the Soviets to exercise a similar preference—which they should find natural—for live Russians in preference to dead Americans. These preferences would be ill served by limiting defenses to very low levels, or zero, although an

all-out defense race is not needed either. What is needed is a ceiling on offensive forces, or better yet, substantial reductions in offensive forces, coupled with the deployment of significant defenses. In general terms, at least, a posture of this type could be developed within any one of the three general categories mentioned in the President's message. Whether it will be, of course, remains to be seen.

Society of Ciphers

Joseph V. Smith is worried regarding the invasion of his privacy by the use of his social security number (Letters, 13 Mar.). I suggest that he relax since the privacy of an individual to all intents and purposes ceased with the passage of the Federal Income Tax Amendment in 1913. . . .

WILLIAM H. BELL

R.F.D. Box 417, Milford, Ohio 45150

In looking through my billfold, I find the following frequently used identification cards, each of which bears a different number: eight credit cards of various kinds, driver's license, firearm owner's registration, private pilot's license, and two insurance company identification cards. In addition, there are at least a dozen other identity numbers which I use on rarer occasions.

The reason for these numbers is the ambiguity of one's name. If we had a system of naming people which would insure no duplication, we would need no numbers, although for data processing purposes the numbers are undoubtedly more convenient. Surely no one would object to having a unique name. Why then an objection to a unique number? Assuming that a unique number is desirable, why not then have only one per person, rather than dozens? The social security number is unique and serves well for identification. The sooner we can persuade our licensing and accrediting agencies to adopt the one number, the more convenient it will be for the individual.

G. W. SWENSON, JR.

Box 2045, Champaign, Illinois 61820

spectrophotometry ...simplified

Spectronic® 100

Sophisticated instrumentation . . . but automation makes it simple. Set wavelength anywhere from 325-925nm—an automatic system drives the grating, interchanges phototubes, stray light and second order filters. Select one of three readout modes—000.0% to 100.0% T, 0.000A to 2.000A, 0000 to 2000 in concentration with selectable positioning of the decimal point. Four place readout gives instant answers.

An entirely new optical design combines fine accuracy and mechanical stability with easy operation. Multiple sampling options include single, multiple and micro flow-thru cell compartments (permitting rapid sampling and minimal, 0.5ml, sample volume)—which accept test tubes, standard rectangular or cylindrical cells, or micro flow-thru cells.

Optical bandpass (resolution) is 8.0nm. A 40-pin connector for BCD output quickly accepts a variety of recording and printout devices—analogue or digital. A unique calibration system is built-in. Write for Catalog 33-6031 or request a demonstration.

Spectronic® 70

So easy to use—just set wavelength, adjust for 100% T or 0.0A with reference, introduce sample and read.

The wide 325-925nm wavelength range is continuous; phototubes and filters are automatically interchanged. All solid state electronics with the latest in integrated circuit technology to assure high stability, reliability, and exceptional precision. Unprecedented sampling flexibility permits use of cylindrical cells up to 50 mm path length and rectangular cells—either semi-micro, short path or constant temperature cells. An accessory outlet allows instant attachment of a variety of readouts. Write for Catalog 33-6030 or a demonstration.

Spectronic® 20

The world's most widely used spectrophotometer. Extremely easy operation, wide 340-950nm range, remarkable stability, low stray light, high sensitivity. Its versatility is further extended by a variety of accessories, including the Concentration Computer for *direct* concentration readings. Over 60,000 in use in laboratories all over the world. Ask for brochure 33-266.

The 4"x5" lab camera that has a mind of its own.

It gives you perfect exposures. Automatically.

From cat jaw to concrete, from spleen to diatoms, whatever you photograph in your lab — the new model Leitz ARISTOPHOT bellows camera with automatic exposure control takes the guesswork out of it.

This exposure system is fully transistorized, with a photomultiplier detector, and practically unlimited exposure range. You get exact exposure control independent of bellows extension, eyepieces and methods of illumination. Exposure control is individually adjustable to the characteristics of each

specimen. And can also be set manually.

The ARISTOPHOT is extremely versatile. It can be used both with a microscope and a macroscopic setup. The film speed range is 6 ASA to 10,700 ASA. The built-in vibration damper on the shutter gives you perfect picture sharpness at all magnifications and shutter speeds.

Write for complete details and specifications to:

The Changing Job Market

Recently, *Science* had an opening for a proofreader. Among the applicants was a Ph.D. in physics, who had been engaged in space research. Our interviewer, feeling that the applicant was overqualified, named a low salary. The physicist still wished to be considered; he said, "That would feed me." Further examples of an anecdotal kind are easily obtainable. They lead to the impression that scientists are experiencing unusual difficulty in finding positions commensurate with their training.

Detailed, up-to-date quantitative evidence on the job market for scientists is scarce. One of the best recent studies was conducted by Mrs. Susanne Ellis* for the American Institute of Physics (AIP). She examined the placement of new Ph.D. physicists during the past 3 years. The study confirmed that applicants are working harder to find jobs. In 1969, 52 percent of candidates sent applications to ten or more potential industrial employers. This figure was up from 29 percent in 1967. At the same time, the number of applicants whose efforts produced no offers rose sharply. The survey revealed that 2.5 percent of the recent doctorate holders are unemployed. But that percentage is deceptively low because, of the 1969 physics Ph.D. graduates, 46 percent have accepted temporary postdoctoral appointments. This figure is up from 6 percent in 1959 and 25 percent in 1967. Most of these temporary appointments were created by the chairmen of physics departments for their own Ph.D. graduates.

The dark picture for physicists has its origins mainly in changes on the academic scene. During the period of exponential growth of federal support, the number of positions available on university staffs increased in spite of a lack of growth in the number of physics undergraduates. This increase in faculties absorbed most of the new Ph.D.'s. When federal support leveled off, physics departments could not justify additional appointments to their staff. Industry and government, which together had been employing about 30 percent of the new Ph.D.'s, could not absorb the surplus. The kind of training that physicists have experienced is partly to blame. The AIP survey reported that nonuniversity employers found that physicists were overspecialized and less adaptable than engineers. Engineers have been obtaining an extensive physics education as part of their engineering training and are now taking positions that formerly went exclusively to physicists.

In part, the employment problems of physicists represent a crisis of expectations. The AIP survey asked recent doctorate holders to name their desired employer. As many as 57 percent named universities (where there are few job openings), whereas only 4 percent named government and almost none named 2-year colleges. The 2-year colleges employ only 1 percent of new Ph.D.'s and could use many more.

An article to be published in *Science*† sets forth results of a survey of many fields conducted by the National Research Council. The survey confirms the finding that most new Ph.D.'s must work harder to find jobs, but differs from the AIP study in its assessment of the extent of unemployment among new Ph.D.'s. The Council report is much more cheerful.

Faced with the possibility of an excess of scientists, the Nixon administration, in its 1971 budget, proposes to cut in half the number of new fellowships and traineeships (*Science*, 1 May). Earlier years have already seen severe pruning of such support. The proposed cuts will have repercussions extending to the high schools, and the full effects will endure for decades. Blinded by the prospects of short-term maladjustments, the administration seems about to stumble into long-term destruction.—PHILIP H. ABELSON

Follow the exciting action as your demineralizer fades away.

Barnstead brings you a play-by-play, on-stream read-out of everyday tap water becoming demineralized water.

Exciting stuff.

The action takes place in our laboratory cartridge demineralizers. You catch the excitement on our direct reading meter that mounts on top. And the whole thing's called Barnstead Bantam.®

Send your water supply through the cartridge. It handles ion exchange (mixed-bed and multi-

bed), organic removal, oxygen removal or cation removal. Set the pace for the action from a steady 5 to a torrid 25 gallons per hour.

Then step back and watch it all happen on the meter. You'll get the full story in parts per million and ohms/cm resistance.

You'll know how well your cartridge is doing and how long it has to do it. There's no wasted cartridge capacity . . . it's good to the last ohm. It sure beats a blinking light that only gives a general idea

of when the action is over. Get viewing excitement and water the way you need it. Your Barnstead dealer has the details on our Bantam Lab Series – meters, cartridges, stands and all. Barnstead Company, 225 Rivermoor Street, Boston, Massachusetts 02132. (617) 327-1600.

THE KLETT FLUORIMETER

No. 2070

Designed for the rapid and accurate determination of thiamin, riboflavin, and other substances which fluoresce in solution. The sensitivity and stability are such that it has been found particularly useful in determining very small amounts of these substances.

KLETT SCIENTIFIC PRODUCTS

PHOTOELECTRIC COLORIMETERS • BIO-COLORIMETERS
GLASS ABSORPTION CELLS • COLORIMETER NEPHELOMETERS • KLETT REAGENTS • COLONY MARKER AND TALLY

animal weighing systems.

Ainsworth has revolutionized animal weighing.

We've designed and developed an Animal Weighing System (the one pictured was developed by Ainsworth for the Upjohn Company) that will automatically provide on-line hard copy and simultaneously-generated computer-compatible punched paper tape weight data on live research specimens.

In addition to the weight data, the System processes data from an animal identification badge and date information in an automatic sequence.

The Ainsworth Animal Weighing System offers:

- Increased speed of operation
- More accurate and convenient operation
- Reduced manpower requirements
- Computer access
- Significant cost saving over conventional methods
- Superior quality control
- Direct-to-computer weighing data free of operator judgment

Ainsworth Automatic Animal Weighing Systems are priced from \$2,900.

Write or call for more information on an Ainsworth Animal Weighing System designed especially for your needs.

glacial sequence is covered disconformably by a widespread Silurian transgression, shales with graptolites. This involves a curious contradiction to traditional ideas of the meaning of graptolitic shales, usually taken to be a deep-water facies with a pelagic fauna. Fairbridge pointed out that there were two sorts of transgression (apart from those involving crustal movement): eustatic and geoidal. A glacio-eustatic rise would only be expected to replace the water glacially removed from the ocean, but an important polar shift would call for a readjustment of the geoid, that would be instantaneous in the case of the ocean, while the crustal adjustment would be quite slow. The Silurian transgression seemed to be one of the second type. As observed in the field, the sub-Tassili (that is, pre-Ordovician) erosion surface lacks major conglomerates, but is marked by small quartz gravels, often "eolized," even with some small "dreikanter." The underlying Precambrian is chemically weathered and leached to a depth of 3 to 4 meters and is capped by a residual hematitic crust or paleosol. Bogdanov pointed out that the age of the last major folding in the shield hereabout was 1.5 to 1.6×10^9 years, but there were some dates indicating 4 to 5×10^8 years. The latter were clearly incompatible with the fossil and structural evidence of unwarped Ordovician.

It is interesting that there is widespread evidence of eolian conditions just prior to the Ordovician in north Africa [a subpolar(?) desert, for example, Gobi], and there is also a widespread Eocambrian glaciation. It seems likely that the hematitic crust (residual lateritic paleosol) and bleaching are relics of seasonably warm wet weathering conditions from well back in the Precambrian. In this environment a semiarid pedimentational history could well have been the last important event before the arid conditions descended. Percy Allen pointed out that wherever we saw the contact there were no fragments of the underlying basement in the transgressive Ordovician pebble conglomerate, which suggested a long intervening period of subaerial history associated with a great climate change. De Charpal noted that the kaolinitic weathering observed by us east of Hoggar became gradually replaced by illite farther to the northwest; this might suggest a late Precambrian pole position still farther to the northwest.

Paul Potter (University of Indiana) presented a clear analysis of the geom-

etry of the sand bodies, emphasizing the distinction between the piedmont fan type that thins distally and paralic type that thins landward. Jean-Philippe Mangin (University of Nice) stressed the unusual relationship in the Ordovician glacials where both the underlying beds were sandstones and so were the tillites. Indeed it seems clear that often the only major difference in lithology was that the underlying sands were frozen, and therefore temporarily "lithified" by permafrost, while the overlying tills were mostly laid down during retreat stages; then, after total deglaciation, the slight differences between "bedrock" and "drift" require very close inspection. Fairbridge questioned the "fluvatile" interpretation of some of the "bedrock" (Ordovician) sands. It was not enough to find them unfossiliferous (actually, they are not), but the structure, granulometry, and gross distribution must be considered. Mixture with both eolian and marine conditions must be regarded as normal. Statistically the chances for continental preservation are always less than for marine. In desert regions such as eastern Saudi Arabia, the desert dune sands (that started as fluvial sands) are regularly dumped onto the beach by the westerly winds and then they are redistributed as offshore bars. Many of the so-called "eolian" sandstones of the American West are regarded by Fairbridge as marine, although the grains may well be "eolized." In the case of the Saharan Ordovician the near-parallel division of most of the cross-bedded units (and the less-than-25-degree dips) speak for a marine setting. The current is systematically north to northwest, which seems to be general paleoslope of the craton, followed later by the ice, and later still by the outwash sandurs. João José Bigarella (University of Paraná, Brazil) confirmed that the structural form of most of the cross-bedding (except in the glacial outwash) was marine.

Adolf Seilacher (University of Tübingen, Germany) demonstrated how he found fossils or tracks of trilobites and traces of other marine life systematically almost through the entire mid-Saharan Ordovician section. The fossils suggest that the glaciation was in or immediately followed the Upper Caradocian. These observations offered further confirmation that the cross-bedding was marine and that the continental glaciers came down to form ice shelves comparable, say, with those of the Ross Sea and the Weddell Sea today.

The last session was devoted to talks
