One Instrument for Four – UNIPHOR

POLYACRYLAMIDE SEPARATIONS TOO!

The LKB Uniphor can save the expense of four other sets of column electrophoresis apparatus, maybe more, but we don't want to boast.

Consider the convenience too. With one piece of LKB apparatus protein chemists can now use the following techniques :

- Powder stabilization
- Sucrose Density Gradient
- Isoelectric Focusing
- Polyacrylamide Gel
- Agarose Gel
- Sephadex

Unique on the market today, the LKB Uniphor permits a free choice of method and provides a completely flexible system in which any stabilization medium can be used. The Elution Stopper, for Polyacrylamide Gel separations, enables the continuous removal of fractionated zones.

No need to remove the gel column from the Uniphor and cut out the separated components for further examination.

Write LKB today for **one** brochure telling you in detail about **four**, and more, methods that you can use with the Uniphor.

AUTHORITATIVE BOOKS IN ADVANCED BIOLOGY

Lentz: CELL FINE STRUCTURE—New

This new atlas contains nearly 200 magnificently clear full-page diagrams depicting the fine structure of mammalian cell types. Each diagram reproduces an ideal cell containing various cellular components which otherwise could only be observed by examining many electron micrographs. Included are cells of every major organ system, including those that are unusual or that have not been extensively investigated. A full explanation of the cytological structure accompanies every illustration. The diagrams are also available on 35-mm slides.

By Thomas L. Lentz, M.D., Yale University School of Medicine. 437 pages. 184 plates. 8½" x 11". \$11.25 (185 slides; \$75)

Giese: CELL PHYSIOLOGY—3rd Edition

The new edition of this advanced undergraduate text reflects new discoveries in cell processes and functions. Dr. Giese carefully describes the functional organization, environment, materials exchange, energy and matter conversion, irritability and contractility of single cells. Major problems in cell physiology are fully discussed. A large number of revealing charts, graphs, drawings and electron micrographs vividly demonstrate the principles and techniques described in this introductory text.

By Arthur C. Giese, Ph.D., Stanford University. 671 pages. 375 figures. \$11.75. May 1968.

Balinsky: AN INTRODUCTION TO EMBRYOLOGY—3rd Edition

The 3rd Edition of this work covers comparative vertebrate biology at the undergraduate level. Dr. Balinsky defines embryology broadly as the science of ontogenetic development of animals and treats both its descriptive and its experimental physiological aspects. The book integrates the contributions of biochemistry and molecular biology with classic studies of the processes of development. Emphasized are topics like placentation, nuclear-cytoplasmic interactions, and gene activity in the processes of differentiation.

By B. I. Balinsky, Dr. Biol. Sci., Univ. of the Witwatersrand. 725 pages. 457 figs. \$10. May 1970.

Barnes: INVERTEBRATE ZOOLOGY—2nd Edition

This widely used text is ideal for a course for students with at least a year of biology or zoology. Each group of invertebrates is correlated with the others phylogenetically. For each phylum, the author discusses anatomy, physiology, taxonomy, and ecology. A taxonomic synopsis of the animal kingdom is provided. This edition includes new chapters on the insects and on animal phylogeny. The various bases of classification are examined, but no single system is espoused. The larger parasitic groups have also been included.

By Robert D. Barnes, Ph.D., Gettysburg College. 743 pages. 581 figures. \$10.50. July 1968.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.			

COVER

Growth patterns in the posterior acoustical structures of an otolith (sagitta) from the fish *Merluccius bilinearis* (Mitchill). Fish otoliths increase in size by daily additions of calcium carbonate and proteinic material in layers (about $\times 580$). See page 1124. [G. Pannella, Yale University, New Haven, Connecticut]

Who said that multi-user programming for a liquid scintillation system is a new idea?

The multi-user concept was born several years ago with our program selector cap.

Each user just dials the selector to the program that matches his optimized counting requirements and slips the cap over the first sample in his sample group. The right program, from up to 12 separate choices, will now be *automatically* selected.

That's the procedure with the 300-sample, temperature-controlled Mark II™ Liquid Scintillation System. You use the program selector cap

to pre-program optimized counting conditions into the Mark II, and you get maximum performance and versatility plus high E^2/B .

This same concept applies to the all-new Isocap/300 Liquid Scintillation Systems. Whether temperature-compensated or temperature-controlled, Nuclear-Chicago's liquid scintillation systems are available with the program selector cap.

Multi-user programming is new? Not at Nuclear-Chicago. Ask your Nuclear-Chicago sales engineer or write to us for the facts on the

Isocap/300™ or Mark II Systems. And ask about the PDS/3 Programmable Data System — it's a whole new way to have data reduction capability for true DPM, and more.

The 1957 Hasselblad. It's enjoying a revival. But not by Hasselblad.

A curious thing is happening in the camera business. Other people are just beginning to build what we discarded in 1957. A 2 1/4" camera with a focal plane shutter.

At the root of the problem is the sudden recognition of the 2 1/4" picture size as one that couples large format quality with miniature camera versatility (something that Victor Hasselblad recognized 23 years ago). The trouble is, with everyone rushing in to make 2 1/4" cameras, quality isn't always a big consideration.

Which is why you should know—before you buy any 2 1/4" camera—why Hasselblad changed from a focal plane to a leaf shutter back in 1957.

FOCAL PLANE SHUTTER

The focal plane shutter has to move across the entire film area, exposing the negative piece by piece, through a travelling slit. When the subject is moving parallel to the film plane, like a moving car, the position of the subject has changed by the time the last slit is exposed. This time lag can create distortion—an elongated or compressed car.

The same thing happens when taking pictures from a moving car or plane. The landscape tends to appear elongated.

In 35mm photography, focal plane shutter distortion is minimized by the short distance the shutter has to travel. But with 2 1/4" cameras, where the shutter has to travel farther, the distortion becomes more noticeable.

LEAF SHUTTER

The leaf shutter, on the other hand (which we call a Synchro-Compur shutter in the Hasselblad) exposes the entire negative area all at once. Which makes it a much more accurate and desirable shutter.

The focal plane shutter has another considerable disadvantage. It can only be synchronized with electronic flash at very low shutter speeds. Which makes it all but useless with strobe for action and sports photography. (At higher shutter speeds, only a strip of the film would get exposed. At slower speeds you end up with ghost images.)

These problems are overcome by the leaf shutter which can be synchronized with all kinds of flash at all speeds and apertures (giving complete control over depth of field and background brightness). Making the leaf shutter far more versatile and useful

to virtually every photographer.

So in 1957, Hasselblad carefully weighed the pros and cons of both shutter systems and decided to change over from the focal plane to the leaf shutter. We had to increase the camera price to do so, because the leaf shutter is a more complex, sophisticated mechanism. But the objective was to build the best camera possible, without being forced to compromise through economic necessity.

We then developed a full line of ten interchangeable lenses, each with its own leaf shutter mounted between the lens elements next to the diaphragm, in the most optically ideal position.

We increased the number of interchangeable film magazines to a total of six, providing a wide variety of different capacities and formats.

We added many accessories, including a microscope shutter and adapter, a gunstock tele-

photo lens mount, and a prism viewfinder with exposure meter. Giving greater flexibility to what was already the most flexible camera system. Leading NASA to choose Hasselblad as the space camera, using it aboard Mercury and Gemini flights, taking it to the moon on the Apollo flights, and for use on Skylab orbiting laboratories.

Many features of the 1957 Hasselblad were well worth copying. In fact we've copied many of them ourselves. But we also knew what not to copy. With the result that most 2 1/4" cameras now employ the shutter system

we abandoned 14 years ago.

Of course, if price is a consideration, you'll have to select a camera with a less costly focal plane shutter. But before you buy a new imitation of the old 1957 Hasselblad, look into the used camera ads. You can probably pick up the real thing for less.

Our black box functions as the control unit of the Nikon AFM Auto-Microflex, part of the most advanced photomicrographic system in the field. Together with the AFM microscope attachment, it comprises a sophisticated instrument that produces high quality photomicrographs simply, surely and automatically. And it attaches to any standard microscope.

The control unit translates the information received from the CdS light sensor in the microscope attachment into required exposure and

shutter times. No need for making light measurements or exposure and timing calculations, anymore. Just program the black box for the ASA rating of the film you're using and the Nikon AFM Auto-Microflex takes over from there.

The result: perfect photomicrographs every time. For complete details, write for our 10 page color catalog.

**Nikon AFM
Auto-Microflex**

Nikon's black box.

**It's a solid state, analog computer that guarantees
perfect photomicrographs every time.**

Fill yourself in on reagents for... Liquid scintillation counting.

In 1969, we made a small, but significant, contribution to science with the introduction of five fundamental reagents for liquid scintillation counting. Small in number... significant in quality... the five are labeled "ANALYZED AND TESTED FOR USE IN LIQUID SCINTILLATION COUNTING." This important statement means that the chemicals meet rigorous specifications which were established after careful consideration of the actual requirements of the individual reagents and of their role in the total system.

These first five were all you needed for some, but not all, applications, and you had one more thin, incomplete catalog to add to an already bulging bookshelf. Now you can declare housecleaning day and dispose of the many catalogs that list only some of the reagents for liquid scintillation counting; now you need only one. It lists all the chemicals required for liquid scintillation counting: twenty-three of them controlled to scintillation-grade specifications, from development to manufacture to labeling, plus 46 other, less commonly used reagents.

**This
helped
answer
a lot of questions.**

The "old" *E. coli*

Courtesy of Dr. C. Brinton

The "new *E. coli*" will help answer the new ones.

The "new *E. coli*"

If man is to unravel the structural and regulatory genetic functions of himself, he can no longer base molecular biological research on the "old" *E. coli*. Human cells are necessary.

The "new *E. coli*" is a diploid, cultured human lymphoid cell which can be cloned or grown in suspension culture and provided in kilogram quantities. As a result of work with the "new *E. coli*," mutant lines and gene markers are being reported regularly. A certain number of markers have already been described; Immunoglobulins (1), Complement C'-3 (2), Interferon (3), Transplantation (HL-A) antigens of the cell surface (4), DNA viruses (5), RNA viruses (6) and Reverse transcriptase - RNA - dependent DNA polymerase (7).

Cultured lymphocyte lines can be derived from patients with genetic deficiency diseases and inborn errors of metabolism with a high degree of success (8).

Recent investigations indicate it will be possible to hybridize cultured lymphocytes with both human and mouse cultured cells or cells taken from blood or other organs (9).

If you are interested in the "New" molecular biology, we would be pleased to share our research with you and provide you with a bibliography of current references.

Start answering the new questions. Write, call or visit ABS for information on the "new *E. coli*."

Now, Automatic Quantitative Microscopic Image Analysis—from Zeiss!

We've added a unique precision scanning stage to our great optics, and the result is the most sophisticated system ever made for microphotometry. It's the Zeiss Scanning Microscope Photometer 05 for **all** types of photometric measurements in transmittance, absorbance, reflectance and fluorescence...and either on-line or off-line computer analysis. Cancer cytologists have already found it an invaluable tool...and other applications are developing daily in both the life sciences and industry.

Here's what this unusual system consists of:

A Zeiss Universal or Photomicroscope. Any analytical system that utilizes a microscope, no matter how sophisticated the electronics, cannot be any better than its optics allow. Information that's lost in the optical channels will not be retrieved in the electronic channels. That's why it's important to start with world-famous Zeiss optics.

A unique Zeiss precision scanning stage. The two available scanning stages allow, respectively, minimum increments of 0.5 and 10 microns, perform up to 200 steps per second, and travel 75mm and 25mm in the X and Y directions in several different scanning patterns, including meander, comb or line.

Much more. A modular electronic system that permits you to select components as you need them and as your budget permits. All the famous Zeiss accessories and photographic and analytical attachments—everything you might ever need for qualitative and quantitative microscopy—are, of course, available. We can even supply a PDP-12 computer with a number of programs prepared by well-known scientists. For the full story, write Carl Zeiss, Inc., 444 5th Ave., New York, N.Y. 10018. Or phone (212) 736-6070.

Nationwide Service.

AMINCO'S NEW UV-VIS SPECTROPHOTOMETER PROVIDES UNEQUALLED VERSATILITY

The AMINCO-CHANCE DW-2 UV-VIS SPECTROPHOTOMETER is a completely new instrument providing total sample handling capability with unparalleled flexibility of operation.

TOTAL SAMPLE HANDLING CAPABILITY: Flexibility built into the cell compartment permits optimum positioning of turbid samples or solutions and allows easy insertion of the Diffuse Reflectance Attachment for opaque or solid samples.

SIX MODES OF OPERATION: SPLIT BEAM MODE — A single monochromator is used to scan entire usable range (200 to 850 nm) or as little as a 75 nm increment of that range. The beam is time-shared through a reference and sample cell. DUAL WAVELENGTH MODE — One monochromator is set at reference wavelength (isosbestic point), the other at a nearby absorption peak. The reference and sample beams are time-shared through a single cell. DUAL WAVELENGTH-SCANNING MODE — One monochromator is set at a reference wavelength, the other scans a pre-selected wavelength increment. Beams are time-shared through a single cell. DERIVATIVE MODE — The two monochromators are locked together at slightly different wavelengths and scanned. Beams are time-shared through a single cell. RAPID KINETICS MODE — High speed chopper allows use of the Aminco-Morrow Stopped-Flow Apparatus to monitor rapid reactions in the single beam or dual wavelength mode. SINGLE BEAM MODE — Operates in energy mode.

ALSO FEATURES: ORDINATE EXPANSION to 0.005 Absorbance full scale ☐ RESOLUTION Better than 0.3 nm ☐ BASELINE COMPENSATION via 11 or 31 potentiometers ☐ BUILT-IN REPETITIVE SCAN ☐ TEMPERATURE CONTROL of sample is possible in all modes. ☐ DIGITAL READOUT ☐ PUSHBUTTON CONTROLS

For complete specifications and ordering information contact AMERICAN INSTRUMENT COMPANY, Division of Travenol Laboratories, Inc., 8030 Georgia Avenue, Silver Spring, Maryland.

Now, Zeiss lets you count and measure the previously uncounted and immeasurable.

You do it with the Zeiss Micro-Videomat, a unique TV microscope for quantitative stereometric analysis. With it you can determine areas, particle counts, chord lengths, mean diameters, numerous gray values, particle size distributions, shape factors, interior or exterior surface areas, volumes, weights . . . of cells, alloys, ores, plastics, ceramics . . . wherever you can use a microscope.

Here's what this unusual system consists of:

A Zeiss Universal or Photomicroscope with the world's greatest optics. Any analytical system that utilizes a microscope, no matter how sophisticated the electronics, cannot be any better than its optics allow. That's why it's important to start with a world-famous Zeiss microscope that permits you to use all methods of enhancing image quality.

A unique Zeiss precision scanning stage. The two available scanning stages allow, respectively, minimum increments of

0.5 and 10 microns, perform up to 200 steps per second, and travel 75mm and 25mm in the X and Y directions in several different scanning patterns, including meander, comb or line.

Much more. A TV camera with a high-performance Plum-bicon tube. A TV monitor with control panel that lets you manipulate images for convenient and speedy determinations. An electronic console with an analog computer displaying values on a multi-scale meter or a digital indicator. Provision for off-line or on-line use with a digital computer such as the Wang model shown below. All the famous Zeiss accessories and photographic and analytical attachments—everything you might ever need for qualitative and quantitative microscopy—can, of course, be used. For the full story, write Carl Zeiss, Inc., 444 5th Avenue, New York, N.Y. 10018. Or phone (212) 736-6070.

Surgery has a new early warning system.

It's a Gould Brush biomedical display instrumentation system.

It includes an 8-channel 21" screen monitoring oscilloscope for instantaneous non-glare viewing of the dynamic relationship between critical physiological phenomena. In addition, there's a Brush 480, 8-channel recorder that delivers a continuous written record for post operative review and analysis.

The system is packaged in a roll-around console. You can glide it anywhere. It monitors and measures up to eight parameters, simultaneously including a full range of cardiovascular

and respiratory functions, bioelectric potentials and physical quantities.

The oscilloscope provides large scale, high-contrast traces on a black, phosphor-coated screen. So you can see what it has to say from across a well-lighted room.

The recording system has overall linearity of better than 99½%. The rectilinear traces are sharp, uniform and smudgeless. Plug-in biomedical amplifiers offer measurement ranges from 1μV to 500V and buffered outputs to drive such peripherals as CRT's, tape recorders and computers.

This high-performance system is typical of custom-designed Gould Brush display instrumentation packages. Our selection of components includes all kinds of direct writing recorders from 1 to 8 channels plus a wide choice of transducers, signal conditioners, and oscilloscopes. You'll find complete details in our new 36-page brochure. Contact: Brush Division, Gould Inc., 3631 Perkins Avenue, Cleveland, Ohio 44114.

Circle No. 23 on Readers' Service Card

There are a few people who need more resolution than the 7Å they can get from the world's easiest-to-operate electron microscope.

But they pay for it.

They pay for it in inconvenience, in lost time, and in money. But for most researchers and teachers there's no need to pay this kind of toll. The capability of the new Zeiss EM9S-2 to distinguish fine structures, and the distortion-free magnification range of 700X to 60,000X, are more than is required. And, if you're a member of this majority, you can earn perpetual dividends in time and convenience from the EM9S-2. Look at some of its features:

(1) The unequalled fully automatic camera system.

No other electron microscope, even very complicated ones costing over twice as much, can match it. Everything is automatic . . . from the selected area electron densitometer all the way through to the negative numbering and changing system

. . . and it all works at the touch of just one lever.

(2) The foolproof airlock.

It lets you change specimens in less than 10 seconds, with one hand, sitting down, and in darkness.

(3) The small size.

It's compact, takes up little room, and has all controls at your fingertips.

(4) The low cost.

It's the Volkswagen of electron microscopes, designed for everyday use.

For the full story and the complete specifications, write for our illustrated booklet "How to Operate the World's Easiest-to-Operate Electron Microscope."

THE GREAT NAME IN OPTICS

Circle No. 15 on Readers' Service Card

ATLANTA, BOSTON, CHICAGO, COLUMBUS, DALLAS, DENVER, HOUSTON, KANSAS CITY, LOS ANGELES, PHILADELPHIA, PHOENIX, SAN FRANCISCO, SEATTLE, WASHINGTON, D.C.

We're kind of a chromatographic hardware store . . . if you don't see it, ask us.

Over recent years, we've developed what is probably the broadest line of chromatographic apparatus and supplies available from one company. Being candid about it, we didn't do it ourselves.

Many of the developments that we've added to our Chromaflex® line came from users—researchers and leaders in the field of chromatography. We paid attention to needs and worked with researchers to solve peculiar problems they had.

Then we had a new piece of ap-

paratus to offer researchers with similar needs.

Some of these items were unique, such as the first separable column with removable fritted disc; the first all-glass ground TLC plates; the first conical bottom Microflex® storage tubes for valuable samples; and recently, the first practical disposable column.

What's meaningful to you now is that many of these firsts have grown into complete lines, and we no doubt have what you need in chromato-

graphic apparatus ready for off-the-shelf delivery.

But unlike a hardware store, we carry only one brand—the Kontes crown—which says quality, no matter what you ask for from us.

Ask your Kontes salesman for our new Chromaflex® Catalog CA-3, or contact the home store.

Nalge brings you implosion-proof Dewar Flasks

The Nalgene one-piece Dewar flask is implosion-proof without taping. It offers double walls of unbreakable cross-linked linear polyethylene and superior chemical resistance. Will not crack when used with liquid nitrogen.

This general purpose Dewar handles cryogenic liquids, dry ice-solvent and hot baths. All three sizes are broad-based for extra stability and have wide mouths for greater accessibility.

Available in 1, 2, and 4 liter sizes with insulating covers (Cat. No. 4150). Order from your Lab Supply Dealer. Ask for our Catalog or write Dept. 4109, Nalgene Labware Division, Rochester, New York 14602.

Nalgene® Labware... the permanent replacements.

priorities that gave ascendancy to the seeking of global preeminence over improving the quality of our national life, that these same priorities led to our intervention in Vietnam, and that they are likely to lead to further such interventions, which "seem to undermine the way of life they seek to preserve and spread" (pp. 168-69).

Blankenship would like to use the Apollo decision as an index of the quality of our political decision-making and wants to blame the decision-makers for our not doing better things. He asks, "Why have we had an Apollo but not, for example, a decent health care or welfare system?"—implying that this is part of "a set of questions different from those posed by the author." But I believe my book faces this question squarely. We went to the moon because the values held by the majority of the American people and their leaders in 1961 found Project Apollo congenial. We do not have a decent health care or welfare system because neither in 1961 nor now is there sufficient support in the American polity to accomplish those goals. Thus, if the Apollo decision is an index of anything, it is an index of the values we as a people held in 1961. Blankenship dissents from these values, and so do I. But it is he, not I, who confuses a description of what was with one of what should have been.

JOHN M. LOGSDON

Program of Policy Studies in Science and Technology, George Washington University, Washington, D.C. 20006

Quality Control

Because of its tremendous importance and the real danger of its quietly falling by the wayside, the peer review system so ably defended by Gross (Letters, 9 July) deserves additional and continued support from concerned scientists.

The biological scientific research community, as well as officials of such federal agencies as the National Institutes of Health and the National Science Foundation, has on numerous occasions in the past praised the peer review system as the fairest way to maintain "quality control" over proposed projects, a control doubly necessary in these times of decreased funding of basic research. Scientific merit must remain the sole basis for award of the meager monies available; and the "relevancy" fad folk must realize that,

as Gross also argues, true relevance and "applicableness" will, in the long run, derive far more often from the tackling of well-chosen basic problems than from "direct" approaches when the latter are of a superficial nature or of low scientific merit.

Administrators long out of personal research activity, no matter how well meaning, are seldom as appropriate judges of the quality of a specialized project as are pertinent panels of the principal investigator's peers in that particular field of research.

Injustice to Women Scientists

Our society is overgrown with trivial hindrances to the advancement of women. This is so much a part of our culture that we are scarcely aware of it. Most of these minor injustices would have no effect at all by themselves, but in the aggregate their impact is enormous. They add up to a widespread, low-key slighting of women, a refusal to be aware of what women can do and and are doing. This affects hiring practices quite directly. More important, it diminishes the aspirations of young women and thus compounds the problem. Therefore it is important to call attention to these offenses and to consider their effects.

One such affront to women is the title of the widely used reference work, *American Men of Science*. It offends women scientists, whose biographies are included in the volume but whose existence is explicitly denied in the title. Furthermore, the name suggests at a glance that scientists are men. Since these prestigious volumes are used not only by members of the scientific community but also by students, reporters, and so forth, and are visible in libraries everywhere, this pernicious suggestion reaches many minds.

Like many other disparagements of women, this one was inadvertent. No malice was intended. In 1906, when publication of *American Men of Science* began, the title may well have been appropriate. This is no longer the case.

**For laboratories that
don't need an 'expensive'
top loader, yet can't use
a 'cheap' one...**

The new Sartorius 1100. Only \$445.

Why pay for an expensive balance your lab may not really need? Why buy slower and cruder equipment that doesn't meet today's standards? Sartorius solves the dilemma with its new Series 1100 top-loaders—the first balances to bridge the gap between modern design and low price.

At only \$445, the Series 1100 offers many features usually found only on more expensive, sophisticated weighing instruments. For example: all-digital readout; results in less than 3 seconds; wide-range mechanical taring; fast, easy operation with no weights to handle and not even any dialing of built-in weights. It's a torsion-type balance, and the optical scale covers the entire weighing range.

Available in three different capacity/accuracy

ratios—1000g/0.1g, 200g/0.015g and 100g/0.01g—these new, reasonably priced balances are ideal for a variety of applications, from student use and research to quality control weighings.

If you're in the market for a new balance for weighing in the range from less than 100 grams up to 1500 grams, you really ought to find out more about the new Series 1100. We'll be happy to send you complete literature and our free 52-page catalog. Just write: Sartorius Division, Brinkmann Instruments, Catiague Rd., Westbury, N.Y. 11590.

sartorius balances

ASK WHAT AN ISCO UV MONITOR CAN DO FOR YOU

It will do your job.

It will operate at 254 m μ , 280 m μ , or other wavelengths to 950 m μ . It can record two wavelengths at the same time, or two columns at the same time. It features high sensitivity *plus* wide range. Flow cells for fractionating density gradients, as well as new micro volume chromatographic cells, are available for special applications.

It will save you time.

Direct absorbance monitoring of your columns eliminates endless cuvette handling. Wavelengths are selected by turning a knob; calibration standards are built in; and standard flow cells require no degassing.

It will save you money

The Model 224 with dual beam optical unit operating at 254 and 280 m μ is priced at \$1095.00, less than all other popular monitors not having ISCO's features.

It won't let you down.

The over 2500 ISCO flow monitors in use for the last ten years have gained an enviable (and deserved) reputation for reliability. New solid state electronics make the Model 224 even more maintenance free.

ISCO also makes other UV monitors and more instruments for biochemical research, all described in our current catalog with the brown square on the cover. Send for it today.

Mass Transit Subsidies

Constance Holden, in her report on mass transit (News and Comment, 11 June, p. 1118), says that "mass transit systems cannot be self-supporting, but must be subsidized, *just as automobile travel is*" (italics added).

She should know that highway travel pays its own way, capital and operating costs, just as she recognizes the need for mass transit subsidies—subsidies amounting to more than half the total operating costs. The effect of such misleading statements, were they to bear fruit, could put far too great an economic load on our society to allow them to pass unchallenged.

FRANK T. BARR

8623 Northeast 10 Street,
Bellevue, Washington 98004

Barr has a point, although, strictly speaking, once taxes become government property and are then redistributed for a specific purpose they can be called subsidies. Also, some areas are clearly getting more from the redistribution than what they put in.

The Highway Trust Fund clearly encourages the use of the automobile. Road users have no choice about where their taxes go. They go into the construction of more roads, with the result that many have been built simply because the money has been available to build them—which in turn generates more user taxes, especially since alternative modes of transport have been left to wither. Nixon himself has acknowledged this imbalance, since under his revenue-sharing proposal he suggests that states be able to use money originally earmarked for highways as they see fit.—C. HOLDEN

Future Ph.D.'s

Because of the shortage of jobs traditionally requiring Ph.D.'s, many proposals have been made to reduce the number of graduate students by administrative measures. This "manpower" approach to the problem overlooks the fact that many graduate students are motivated by a desire for knowledge and not just a desire for a job in a particular field. A qualified student who wants to learn, say, theoretical physics should be allowed to do so even if he may have to work in another field when he finishes. Of course, he should be aware of this risk, and

Measure temperature quickly and accurately from -80 to $+150^{\circ}\text{C}$ with YSI Telethermometers. Choose from a large selection of thermistor probes and over 90 thermometer model and range combinations. Single or multi channel, manual or automatic, wide range or narrow. Most instruments are battery operated and all have millivolt outputs for convenient recording. Send for catalog.

Temperature

Recorders

To record temperature or other D.C. signals consider YSI's single and dual channel strip chart recorders. They're new, versatile and inexpensive. Ranges are 10mV to 100V and 1 μ A to 10mA full scale. Zero offset and span controls provide up to 10 times scale expansion. Chart speeds are 1" to 60"/hr and marking is inkless. Write for details.

should not be entitled to a full subsidy for his education. A more serious problem for higher education is the premature filling of tenure slots. In computer science, the next 10 years will produce a generation of new Ph.D.'s more qualified than those of us who now hold the professorships. If these new Ph.D.'s are frozen out, the field will suffer.

JOHN MCCARTHY

Flying Saucer Sightings

D. I. Warren (6 Nov., p. 599) has brought forth an interesting theory. A number of people that I have talked to reported that the only reason they happened to see the flying saucer was because they went outside to "see what was bothering the horses." So it was really the horses who first sighted the UFO. When horses are used for the primitive task of simply supplying tractive power, they are undoubtedly victims of the status frustration syndrome. Therefore the theory must be valid.

Sirens' Songs

In "Songs of humpback whales" (13 Aug., p. 585) Payne and McVay mention "the possibility . . . that some other species have been included with . . . [their] data on humpbacks." Although they refer to several species of whales, they fail to mention the most likely candidates, the Sirens. Their song has been described as "clear" by Circe and their voice "sweet as a honeycomb" by Ulysses. These definitions compare well with that of Payne and McVay: "beautiful and varied sounds." It is unfortunate that no recording of the Sirens' songs was made by Ulysses (probably because his hands were tied at the time); it would have been interesting to compare it to the recordings made by Payne and McVay.

bottom line

These new clear disposable mouse cages come fully nested, yet have stacking posts to prevent jamming. You also have the option of ordering them pre-packed with the finest animal bedding we know of - **ab-sorb-dri**.® It's patented.* You save time, labor costs, storage space, and shipping costs. Even with bedding in them, 100 cages take up less than 4 cubic feet, less than half the volume of other disposable cages. Means more usable storage space for you. All of these features add up to a savings of 50% or more over other types of disposable cages. Made of clear polystyrene, these cages accept standard lids and covers. In addition, they have molded flanges for use in suspension racks. Your research work will go easier—

every day—because you don't have to worry about the labor of filling each cage with bedding. Another contribution to small animal care from Lab Products, a new company of experienced people with new ideas in lab animal care equipment. We have them all in a catalog. For your copy, write or call Lab Products, Inc., 635 Midland Avenue, Garfield, N. J. 07026, (201) 478-2535.

**Sure your old microscope
still works, so does
Leeuwenhoek's
...but not
like the
Dialux®**

How many pieces of your laboratory equipment are as outdated as your microscope?

You've probably changed refrigerators, centrifuges, microtomes, colorimeters, but your tired old microscope still goes laboring along.

It's time you looked at the Dialux. The "today" design of this microscope is only the beginning. Enjoy the advantages of truly wide-field observation, high-intensity illumination, crisp, sharp, flat-field objectives. Mechanical performance that feels more

like silk than metal. Interchangeable components that permit either brightfield, darkfield, phase contrast, fluorescence and polarized light microscopy.

Think of how nice your "old" microscope will look on your library shelf and what an improvement the Dialux will make on your laboratory bench.

Drop us a line and we will send you a most convincing brochure on the remarkable new Dialux.

International Cooperation in Science

No matter what the motivation, international scientific cooperation is only as good as the science put into it, and it can be successful only if both sides are keenly interested in making it work.

At least, this seems to be the lesson to be derived from the United States-Japan Cooperative Medical Science Program, whose Joint Committee held its seventh meeting recently in Washington. This project arose out of general political discussions between the United States and Japan and was first announced as item 13 in the communiqué issued at the conclusion of Prime Minister Sato's 1965 visit to Washington. It has since become a fine example of an intergovernmental scientific relationship that is functioning extremely well. Although it was intended primarily to benefit the people of Asia, its results are widely available.

Concrete evidence of this is to be found in the form of a 5-year report just issued on the results of research in the six disease categories chosen for inclusion in the program—cholera, leprosy, malnutrition, parasitic diseases, tuberculosis, and viral diseases. These results have been and continue to be substantial.

The interest of both parties in the program has continued to run high, and it has been well financed by both sides. American funding through the National Institutes of Health has been appropriate, and a small, separate staff administers the program. Our members of the Joint Committee, appointed by the Secretary of State, are leading medical scientists with a deep interest in the program. From both Japan and the United States, the Joint Committee members are, in effect, the senior statesmen, but a consistent effort has been made to involve younger scientists.

A number of other factors have also contributed to the success of the program. Although only six disease categories were selected, within each of these the research effort has been further limited to discrete objectives where progress is likely to have large effects; that is, the areas of interest are carefully selected and quite specifically defined. In addition, there is an equitable balance between the relative scientific contributions coming from investigators of the two nations involved. This is not an instance of one country scientifically assisting another; rather, there is an equality of input from both sides. The identification and further definition of research goals are mutual, a joint activity rather than unilateral scientific domination and direction. Finally, and of particular importance in the United States, management of this program has been delegated to the level in government where there is existing research which complements that of the program.

We are aware, of course, that the United States is engaged in a large number of bilateral programs with a number of countries. Indeed, there are three other programs with Japan alone, including the oldest active U.S. program of this nature, the United States-Japan Agreement on Scientific Cooperation, which held its eleventh annual meeting in Tokyo in July.

Our experience with the United States-Japan Cooperative Medical Science Program has convinced us of the usefulness of such agreements. The Department of State values highly the political benefits arising as a by-product of the program—the deepening understanding between two nations engaged in common research. The scientists value highly the effective and efficient manner in which the best talents of two countries have been organized and focused on the problems they are dealing with. This is a combination that is hard to beat.—COLIN MACLEOD, *Chairman, U.S. Delegation of the United States-Japan Cooperative Medical Science Committee*, and HOWARD A. MINNERS, *Secretariat, National Institutes of Health*.

Bausch & Lomb has been completely successful in cancelling out inflation effects while bringing you new Academic Microscopes with outstanding advantages such as...

- Flat field optical system for sharpest images edge-to-edge
- Wide field eyepieces for longer eye relief and increased usable field of view
- Low position coaxial coarse and fine adjustments for greater comfort and convenience

- Exclusive Harmonic Drive with continuous fine adjustment
- Choice of built-in base illuminators
- Interpupillary distance adjustment with constant tube length
- Choice of plain, glide or ball-bearing mechanical stage with low position coaxial controls
- Choice of reversible binocular or monocular head. Monocular takes a teacher's observation eyepiece.
- Focusable rack and pinion substage with removable 1.30 N.A.

Count Colonies Automatically!

Bacterial colonies can be recorded quickly and accurately in a *single* probing action with the Bactronic Colony Counter, which marks as it counts automatically in open and closed petri dishes. An electronic probe picks up radio impulses on contact with *any* agar medium, actuates the counting mechanism, and leaves an identifying puncture in the agar. If puncturing is undesirable, a plug-in marking pen or grease pencil can be used to mark the back of the plate as it counts. A special system of illumination floods the plate with uniform, glare-free light that accentuates colonies in bold relief. Even pin-point colonies are clearly discerned. This transistorized instrument is equipped with a Sterilizing Probe Well, automatic numerical reset to zero and magnifying lens. Ask for catalog C-110S/971.

The Brinkmann Gel Column

Slicing It Pretty Thin

It's a safe bet you won't find one in every household. Or in every laboratory. But if you're moving in the sort of specialized area of electrophoretic analysis of RNA, for example, and you have to serve up slices of polyacrylamide gels, a lot of laboratory types think the MICKLE GEL SLICER is the best thing since delicatessens.

It figures.

How else can you cut a frozen gel column up to 10 cm long and 1 cm thick into flawless slices of less than 1.0 mm, in increments of 0.1 mm, and leave the rest of the column undisturbed?

Cutting force and blade angle are adjustable for hard-frozen dilute gels, or softer, concentrated cylinders. Slices are easily collected for processing and scintillation counting.

Twenty cuts per minute. Foot switch leaves hands free. Electromagnetic counter keeps score on slices. Write for complete details.

How To Look Good, Fast.

Costs being what they are today, the guy (or gal) who can save a few dollars gets the hero medal. Here's a way to look good while you're looking good and fast (while you're rapidly scanning polyacrylamide gel columns optically, that is).

Be the first to recommend purchase of the VICON LINEAR GEL SCANNER—the attachment that fits right into your Zeiss PMQ II Spec. cell compartment without modification (and avoids costly instrument duplication).

It scans at 6 mm/min—even faster (25 mm/min) for coarser separations—in either direction. Resolution? Slit aperture is 100 μ thin to catch those narrow bands. Columns to 10 x 100 mm can be handled. Wavelength is variable from 200 to 750 m μ . And there are a host of options available to meet your specific needs. Want to scan fast? Want to look good? Get the details. Write:

roplasts from C_4 plants is associated with modification of the biochemistry of CO_2 fixation and may be reflected in the initial products of photosynthesis as proposed by W. J. S. Downton.

The presentations of the biochemistry of photorespiration were one of the highlights of the seminar. M. Gibbs emphasized the close association of carbon metabolism and light reactions during glycolate synthesis, and N. E. Tolbert reported advances with respect to glycolate metabolism in leaf peroxisomes or microbodies. This work was complemented by the structural studies of plant microbodies by E. H. Newcomb and the comparative view of plant microbodies presented by H. Beevers. Photorespiration was considered to be the biosynthesis of glycolate from the photosynthetic carbon cycle and its metabolism in peroxisomes. The magnitude of this respiration increases with O_2 concentration and under conditions of impaired CO_2 fixation. Glycolate biosynthesis in the light in the chloroplasts was viewed as unavoidable, and its subsequent metabolism as gluconeogenic to conserve part of the carbons. W. A. Jackson described the exchange of oxygen associated with photosynthesis and photorespiration, and this technique may permit quantitative estimates of photorespiration in C_4 plants in which the CO_2 produced does not escape from the leaf. In many instances, C_4 plants appear to conserve photorespiratory carbon by refixation of the CO_2 during photosynthesis. In addition, C. B. Osmond provided data suggesting that some C_4 species are deficient in the photorespiratory apparatus. The biochemistry of CO_2 release during photorespiration and in serine formation were evaluated.

Several contributors helped to place the biochemical and anatomical information from the seminar into a physiological and ecological context. It was shown that minimum stomatal diffusion resistances tend to be higher in C_4 than in C_3 plants. Therefore the C_4 plant tended to have a reduced transpiration per unit leaf area. Although CO_2 transport into the leaf also was similarly impeded, this extra gas phase resistance is more than counterbalanced by the much lower intracellular CO_2 resistances in C_4 plants. Hence, total net CO_2 transport resistance tends to be lower, and overall photosynthesis more efficient, than in C_3 plants. As a consequence of higher stomatal and lower intracellular

NOW! 35% Discount on CRC's Automated Labwashers

SAVE! Buy direct from the manufacturer.

(offer ends Dec. 31, 1971)

The CRC Labwasher®

The new CRC Labwasher® offers improved glassware washing plus plasticware cycle.

Our new line of labwashers will end your labware washing problems. Their fully automatic washing cycles produce spotlessly clean and dry labware, including plasticware, quickly and efficiently.

They cut glass labware breakage in half, and soon pay for themselves in man-hours saved.

- Choice of undercounter, free-standing or mobile models
- Choice of tap or distilled water rinses (up to 3)
- Dual-Temp Forced-Air Drying
- Booster heater for elevating and maintaining water temperatures
- Convenient front loading with roll-out racks
- 16 stainless steel accessory racks handle glass labware or plasticware

lar resistance, water use efficiency tends to be higher in C_4 than in C_3 plants.

The intracellular resistance is composed of physical and biochemical components, the latter being identified with the carboxylation reactions. Several attempts were made to partition the intracellular resistance into these two major components by theoretical analysis, but these procedures were queried. Experimental evidence implied that the main component of the intracellular resistance was the carboxylation resistance. This was also supported by other data for a close relationship between intracellular resistance and levels of RuDP carboxylase activity. Such evidence suggests that, even in C_4 plants, levels of RuDP carboxylase activity may be a major limitation to photosynthetic rate. In C_4 plants the lower intracellular CO_2 resistances probably result from the efficiency of the PEP carboxylation system in the CO_2 concentrating ability of the mesophyll cells.

In terms of adaptation and evolution, it is clear that, in arid environments with high solar radiation and high day temperature, C_4 plants have several advantages over C_3 plants. The C_4 plant has no apparent photorespiration, greater photosynthetic efficiency under high light intensity and higher temperature optimums, and makes more efficient use of water. However, R. O. Slatyer emphasized that one cannot extrapolate directly from single leaf studies to the behavior of whole plants or plant communities, since many factors contribute to overall growth and water use. Furthermore, with regard to economic food yield, such as yield of grain, many other factors must be considered and potential rate of leaf photosynthesis is only one determinant.

In evolutionary terms it appears that both C_4 plants and plants with CAM have arisen polyphyletically among several of the more advanced orders of both dicotyledenous and monocotyledenous plants. The Caryophyllales and the Euphorbiales include both CAM and C_4 plants, but several other orders include only one or the other. All plants apparently rely on the photosynthetic carbon cycle for the ultimate steps in CO_2 fixation. In CAM and C_4 plants, the C_4 dicarboxylic acid products serve essentially as mechanisms for prefixing and concentrating CO_2 in the photosynthetic tissue. Furthermore, in primitive aquatic

Now

...for the very first time

... you can have shadowless incident illumination of recessed areas, deep crevices, reflecting surfaces. Bausch & Lomb's new, patented Coaxial Illuminator beams pre-aligned light down through both sides of the StereoZoom 7 Microscope into those problem areas. The light is then reflected back up the opposite side it originally traveled. The result is such a completely different view of the specimen that you may find it hard to believe your own eyes.

- You can use infinitely variable magnification over a range from 15X to 280X and anywhere in between. Field diameter ranges from 0.55 in. to 0.03 in. You do not sacrifice valuable working distance as with conventional vertical illuminators.

- High eyepoint eyepieces, flat fields, accurate eye level magnification readings on the zoom knob plus Bausch & Lomb quality optics ... there's a combination that has made this the stereomicroscope that users confidently depend on.

- Color filters, green, yellow, blue (approximating daylight) are carousel-mounted within the body of the illuminator and moved in and out of the light beam by a convenient knurled ring. Illumination intensity is controlled by a variable transformer.

- The Coaxial Illuminator is factory-aligned in the back of the power pod of the StereoZoom 7 Microscope convenient to the user but in no way interfering with visual use of the instrument.

- We urge you to try the StereoZoom 7 Microscope with Coaxial Illuminator in your laboratory with your most difficult specimens.

INTRODUCTION TO NUMERICAL ANALYSIS

DONALD GREENSPAN

UNIVERSITY OF WISCONSIN

The problem solving technique necessary to land on the moon or to understand the most complex computers. Here is a straightforward, readable treatment designed to acquaint readers with the newest "new math."

CONTENTS

Preface

Chapter 1. Approximation

Chapter 2. Approximate Integration and Differentiation

Chapter 3. Algebraic and Transcendental Systems

Chapter 4. Second-Order Differential and Difference Equations

Chapter 5. Approximate Solution of Boundary-Value Problems for Differential Equations

Chapter 6. Approximate Solution of Initial-Value Problems for Ordinary Differential Equations

Chapter 7. Discrete Model Theory

7.1 Introduction

7.2 Implications of Constraints on Measurement

7.3 Special Discrete Functions

7.4 Particles, Time and Motion

7.5 Velocity and Acceleration

7.6 Law of Motion

7.7 Damped Motion in a Nonlinear Force Field

7.8 Conservation of Energy

7.9 Momentum

7.10 Angular Velocity and Acceleration

7.11 Remark

Exercises

Chapter 8. Interval Arithmetic

8.1 Introduction

8.2 Interval Arithmetic

8.3 General Application of Interval Arithmetic

8.4 Application to Difference Equations

8.5 Remarks

Exercises

References and Sources for Further Reading

Answers to Selected Exercises

Index

Chapter 7 (Discrete Model Theory) and Chapter 8 (Interval Arithmetic), are Unique to this book as they are found in no other introductory reading on this subject.

Hardcover \$9.50

Computing Reviews says, "This book is indeed what the title promises; an introduction to numerical analysis . . . The material is presented in an easy and lucid manner." The emphasis on computational details makes this an excellent book for problems-solvers and practitioners.

SCIENCE, VOL. 173

environments with low oxygen levels, low light intensity, and the absence of water stress, plants with the C_3 photosynthetic carbon cycle would be at no disadvantage. Only with the colonization of terrestrial environments of high radiation, increasing oxygen levels, and increasing aridity would CAM and C_4 acid fixation and metabolism be advantageous. Again, though, it was emphasized that competitive evolutionary advantage is not just a matter of leaf photosynthesis.

Clinical Aspects of Inherited Disorders

Genetically determined growth deficiencies, cancer genetics, genetic carrier detection, prenatal chromosome analysis, and prenatal detection of inborn errors of metabolism were some of the topics discussed at a meeting on the clinical aspects of inherited disorders held at the Medical Center, University of Alabama in Birmingham, on 9 and 10 April 1970. The meeting was opened by J. F. Volker, president, University of Alabama in Birmingham, and John Leslie, regional medical director, Maternal and Child Health Services, Health Services and Mental Health Administration.

D. W. Smith (Seattle) discussed the genetic basis for clinical disorders and presented a new classification of growth deficiency syndromes. He emphasized the importance of genetic disorders in medical problems and classified their source as (i) genetic imbalance in which there is a numerical or structural abnormality of the chromosomes, (ii) a major mutation which is transmitted in an autosomal dominant, autosomal recessive, or X-linked manner, and (iii) polygenic factors which include multiple minor variants interacting with the environment. Smith listed the presumed frequency of newborns who have or will have a disorder due to each of the three types of genetic determinations as 0.5 percent for chromosomal imbalance, 1 percent for one of the approximately 1500 individually rare disorders caused by major mutants, and

10 percent for a disorder due to polygenic factors including common malformations, diabetes mellitus, schizophrenia, and the like.

C. J. Witkop, Jr. (Minneapolis), discussed genetic heterogeneity, particularly in gingival fibromatosis and amelogenesis imperfecta. He indicated that recent developments in biochemical genetics have shown the heterogenetic character of many human traits that previously were thought to be determined by single genes.

After discussing the role of hereditary factors in cancer of the skin, endometrium, breast, and colon, H. T. Lynch (Omaha) emphasized the potential for cancer control through utilization of genetic information for early cancer detection in individuals that are at increased risk.

In discussing the question, "How can the teratogenic action of a factor be established in man?" W. Lenz (Münster, West Germany) indicated that few such factors are definitely known in man though many have been suspected. He contrasted the findings due to thalidomide with the drug Meclizine, which has come under suspicion. Comparison of thalidomide embryopathy was made with phenocopies and other established syndromes having similar clinical features. He further indicated the great need for the collection and analysis of data on intake of drugs, such as LSD, in order to answer the question as to its teratogenic properties in man. J. Warkany (Cincinnati) discussed other aspects of determining the teratogenicity of a drug and observed that we should not neglect the single case that may be caused by an unknown teratogen, and therefore that we should be most careful in drawing conclusions. Use of serum enzymes, muscle biopsies, and electromyography in diagnosis and detection of carriers of the gene for muscular dystrophy were discussed by C. M. Pearson (Los Angeles).

James L. German (New York) discussed disturbances of sexual development and the role in human sexual differentiation of various genetic determinants on the X and Y chromosomes. In the last few years new approaches to the study of growth regulation and to human behavioral disorders have been made through the study of sex chromosomal aberrations.

The autosomal aberration syndromes were discussed by W. Finley (Birmingham).

I. A. Uchida (Hamilton, Ontario)

Praise the Lourdes.

Beta-Fuge™

Vernitron enters the research lab with Lourdes Beta-Fuge...the only centrifuge that combines 4 litre rotor capacity with the highest possible speed. Features include patented continuous flow system with 1.8 litre sediment capacity, "Fail-Safe" brush life control, sliding top door for easy loading and unloading, solid state speed control, and temperature control range for -20°C to plus 40°C.

For size and speed, there's no better centrifuge for your laboratory than the Lourdes Beta-Fuge. For more information, write Vernitron or contact your local dealer...today. And you, too, will praise the Lourdes.

YOU MEAN I CAN GET \$50,000 OF TIAA LIFE INSURANCE FOR LESS THAN \$100?

That's what an Assistant Professor asked us when he heard about TIAA's low life insurance costs.

It's true. At his age 30 the annual premium for a 20-Year Home Protection policy providing \$50,000 initial amount of insurance is \$159.00. The first-year dividend, based on our current dividend scale, is \$61.50, making a net payment of \$97.50. Dividends, of course, are not guaranteed.

The Home Protection plan is level premium Term insurance providing its largest amount of protection initially, reducing by schedule each year to recognize decreasing insurance needs. This is just one example of the many low-cost TIAA plans available. If you need more protection for your family, ask us to mail you a personal illustration with figures for a policy issued at your age. We'll also send the Life Insurance Guide describing other TIAA policies.

ELIGIBILITY

Eligibility to apply for this or other TIAA life insurance is limited to persons employed at the time of application by a college, university, private school, or other nonprofit educational or scientific institution that qualifies for TIAA eligibility.

outlined the study which she and her colleagues designed in order to ascertain the association between diagnostic x-rays and the risk of a trisomy offspring.

In the discussion of prenatal chromosome analysis, M. N. Macintyre (Cleveland) indicated how this procedure might be considered lifesaving since, without this technique, families at risk for having a child with a chromosomal aberration syndrome might be advised by the counselor to avoid further pregnancies.

H. L. Nadler (Chicago) discussed the use of cell cultures and his present experience with regard to the detection of inborn errors of metabolism prenatally and mentioned the genetic disorders for which such diagnoses are possible. The direction of things to come in the treatment of genetic disorders were discussed by J. H. Menkes (Los Angeles).

A panel on the special problems of the abnormal child was moderated by C. J. Rosecrans (Birmingham). M. M. Cohen (Boston) discussed some of the dental problems in mentally retarded children, especially in Down's syndrome. R. B. Allison (Birmingham) outlined some of the problems in the psychological evaluation of mentally retarded children. S. Davis (Birmingham) summarized the functions of the University Affiliated Facility at the University of Alabama in Birmingham and the various diagnostic resources available to the family physician with regard to the evaluation of children with congenital malformation syndromes. J. Money (Baltimore) compared the psychologic findings in patients with sex chromosomal aberration syndromes.

Another panel, concerned with prevention of genetic disease, was moderated by E. G. Waldrop (Birmingham). Subjects covered during this discussion were genetic counseling, by S. C. Finley (Birmingham); therapeutic abortion, by A. C. Christakos (Chapel Hill); amniocentesis, by R. V. Barnett (Birmingham); and the psychiatric aspects of therapeutic abortion, by P. H. Linton (Birmingham).

The seminar was supported by Project 262, Maternal and Child Health Service, Health Services and Mental Health Administration, Department of Health, Education, and Welfare.

This one-gallon laboratory "workhorse" has all the power you will ever need for high-speed reduction of solids. You can grind, emulsify, disintegrate, homogenize, shred, blend, or mix in seconds! The container, cover, and blending assembly are stainless steel, easy to clean, and trouble free. An ingenious adapter lets you use smaller containers on the one-gallon base.

Waring also makes one-quart models (some with timers, some with 7-speed controls), explosion-proof models, and accessories from 12 ml Mini Containers to ice crusher attachments. All are ruggedly constructed and warranted for one year of commercial use.
