

Instructions for Contributors

The Editors of *Science*

Manuscripts submitted to *Science* for consideration for publication can be handled expeditiously if they are prepared in the form described in these instructions.

Submit an original and two duplicates of each manuscript. With the manuscript send a letter of transmittal giving (i) the name(s) of the author(s); (ii) the title of the paper and a one- or two-sentence statement of its main point; (iii) the name, address, and field of interest of four to six persons in North America but outside your institution who you think are qualified to act as referees for your paper; (iv) the names of colleagues who have reviewed your paper for you; (v) the field(s) of interest of readers who you anticipate will wish to read your paper.

Editorial Policies

All papers submitted are considered for publication. The author's membership or lack of membership in the AAAS is not a factor in selection. Papers are accepted with the understanding that they have not been published, submitted, or accepted for publication elsewhere. Authors will usually be notified of acceptance, rejection, or need for revision in 4 to 6 weeks (Reports) or 6 to 10 weeks (Articles).

Types of papers. Five types of signed papers are published: Articles, Reports, Letters, Technical Comments, and Book Reviews. Familiarize yourself with the general form of the type of paper you wish to submit by looking over a recent issue of the journal, and then follow the instructions for that type of paper.

Reviews. Almost all Articles, Reports, and Technical Comments, whether solicited or not, are sent to two or more outside referees for evaluation of their significance and soundness. Forms showing some of the criteria reviewers are expected to consider are available on request.

Editing. Papers are edited to improve the effectiveness of communication between the author and his readers. The most important goal is to eliminate ambiguities. In addition, improvement

of sentence structure often permits readers to absorb salient ideas quickly. When editing is extensive, with consequent danger of altered meanings, papers are returned to the author for correction and approval before type is set. Authors are free to make additional changes at this stage.

Proofs. One set of galley proofs or an equivalent is provided for each paper. Keep alterations to a minimum, and mark them only on the galley, not on the manuscript. Extensive alterations may delay publication by 2 to 4 weeks.

Reprints. An order blank for reprints accompanies proofs.

Writing Papers

Organize your material carefully, putting the news of your finding or a statement of the problem first, supporting details and arguments second. Make sure that the significance of your work will be apparent to readers outside your field, even if you feel you are explaining too much to your colleagues. Present each step in terms of the purpose it serves in supporting your finding or solving the problem. Avoid chronological steps, for the purpose of the steps may not be clear to the reader until he finishes reading the paper.

Provide enough details of method and equipment so that another worker can repeat your work, but omit minute and comprehensive details which are generally known or which can be covered by citation of another paper. Use metric units of measure. If measurements were made in English units, give metric equivalents.

Avoid specialized laboratory jargon and abbreviations, but use technical terms as necessary, defining those likely to be known only in your field. Readers will skip a paper they do not understand. They should not be expected to consult a technical dictionary.

Choose the active voice more often than you choose the passive, for the passive voice usually requires more words and often obscures the agent of action. Use first person, not third; do

not use first person plural when singular is appropriate. Use a good general style manual, not a specialty style manual. The University of Chicago style manual, the style manual of the American Institute of Physics, and the *Style Manual for Biological Journals*, among others, are appropriate.

Manuscripts

Prepare your manuscript in the form used by *Science*. Use bond paper for the first copy. Submit two duplicates. Double-space title, abstracts, text, signature, address, references (including the lines of a single reference), figure legends, and tables (including titles, columns, headings, body, and footnotes). *Do not use single spacing anywhere.* Put the name of the first author and the page number in the upper right-hand corner of every page.

Paging. Use a separate page for the title; number it page 1. Begin each major section—text, references and notes, and figure legends—on a new sheet. Put each table on a separate sheet. Place figure legends and tables after the references.

Title. Begin the title with a word useful in indexing and information retrieval (not "Effect" or "New").

References and Notes. Number all references to the literature, footnotes, and acknowledgments in a single sequence in the order in which they are cited in the text. Gather all acknowledgments into a single citation, and keep them short ("I thank," not "I wish to thank"). Cite all references and notes but do not cite them in titles or abstracts. Cite several under one number when feasible. Use the "BioSciences Information Service of Biological Abstracts," BIOSIS, with the few suggested revisions in *International List of Periodical Title Word Abbreviations* for abbreviations of journal names. If the journal is not listed there, provide the full name. Use the following forms:

Journal: H. Smith, *Am. J. Physiol.* **98**, 279 (1931).

Book: F. Dacheille and R. Roy, *Modern Very High Pressure Techniques* (Butterworth, London, 1961), pp. 163–180.

Chapter: F. Dacheille and R. Roy, in *Reactivity of Solids*, J. H. de Boer, Ed. (Elsevier, Amsterdam, 1960), p. 502.

Illustrations. Submit three copies of each diagram, graph, map, or photograph. Cite all illustrations in the text and provide a brief legend, to be set in type, for each. Do not combine line drawings and photographs in one illus-

tration. Do not incorporate the legend in the figure itself. Use India ink and heavy white paper or blue-lined coordinate paper for line drawings and graphs. Use heavier lines for curves than you use for axes. Place labels parallel to the axes, using capital and lower-case letters; put units of measurement in parentheses after the label—for example, Length (m). Plan your figures for the smallest possible printed size consistent with clarity.

Photographs should have a glossy finish, with sharp contrast between black and white areas. Indicate magnification with a scale line on the photograph.

Tables. Type each table on a separate sheet, number it with an Arabic numeral, give it a title, and cite it in the text. Double space throughout. Give each column a heading. Indicate units of measure in parentheses in the heading for each column. Do not change the unit of measure within a column. Do not use vertical rules. Do not use horizontal rules other than those in the heading and at the bottom. A column containing data readily calculated from data given in other columns can usually be omitted; if such a column provides essential data, the columns containing the other data can usually be omitted.

Plan your table for small size. A one-column table may be up to 42 characters wide. Count characters by counting the widest entry in each table column (whether in the body or the heading) and allow three characters for spaces between table columns. A two-column table may be 90 characters wide.

Equations and formulas. Use quadruple spacing around all equations and formulas that are to be set off from the text. Most should be set off. Start them at the left margin. Use the solidus for simple fractions, adding the necessary parentheses. But if braces and brackets are required, use built-up fractions. Identify handwritten symbols in the margin, and give the meaning of all symbols and variables in the text immediately after the equation.

Articles

Articles, both solicited and unsolicited, may range in length from 2000 to 5000 words (up to 20 manuscript pages). Write them clearly in reasonably nontechnical language. Provide a

title of one or two lines of up to 26 characters per line and a subtitle consisting of a complete sentence in two lines with a character count between 95 and 105 for the sentence (spaces between words count as one character each). Do not break words at the ends of lines. Write a brief author note, giving your position and address. Do not include acknowledgments. Place title, subtitle, and author note on page 1. Begin the text on page 2.

Insert subheads at appropriate places in the text to mark your main ideas. The set of subheads should show that your ideas are presented in a logical order. Keep subheads short—up to 35 characters and spaces.

Provide a summary at the end.

Do not submit more than one illustration (table or figure) for each four manuscript pages unless you have planned carefully for grouping. With such planning many illustrations can be accommodated in the article. Consult the editorial office for help in planning.

Reports

Short reports of new research results may vary in length from one to seven double-spaced manuscript pages of text, including the bibliography. Short papers receive preferred treatment. Limit illustrative material (both tables and figures) to two items, occupying a total area of no more than half of a published page (30 square inches). A research report should have news value for the scientific community or be of unusual interest to the specialist or of broad interest because of its interdisciplinary nature. It should contain solid research results or reliable theoretical calculations. Speculation should be limited and is permissible only when accompanied by solid work.

Title. Begin the title with an important word (preferably a noun) that identifies your subject. The title may be a conventional one (composed primarily of nouns and adjectives), a sentence (containing a verb), or a structure with a colon (Jupiter: Its Captured Satellites). Limit it to two lines of complete words of no more than 55 characters per line (spaces between words count as one character each). Do not use abbreviations. Type the title in the middle of page 1.

Abstract. Provide an abstract of 45 to 55 words on page 2. The abstract should amplify the title but should

not repeat it or phrases in it. Qualifying words for terms used in the title may be used. Tell the results of the work, but not in terms such as “——— was found,” “is described,” or “is presented.”

Text. Begin the text on page 3. Put the news first. Do not refer to unpublished work or discuss your plans for further work. If your paper is a short report of work covered in a longer paper to be published in a specialty journal, you may refer to this paper if it has been accepted. Name the journal. If the manuscript has not been accepted, refer to it as “in preparation.” Omit references to private communications. Do not use subheads.

Signature. List the authors on the last page of the text and give a simple mailing address.

Received dates. Each report will be dated the day an acceptable version is received in the editorial office.

Letters

The Letters section provides a forum for discussion of matters of general interest to scientists. Letters are judged only on clarity of expression and interest. Keep them short and to the point; the preferred length is 250 words. The editors frequently shorten letters. See instructions for the preparation of manuscripts.

Technical Comments

Letters concerning technical papers in *Science* are published as Technical Comments at the end of the Reports section. They may add information or point out deficiencies. Reviews are obtained before acceptance.

Book Reviews

The selection of books to be reviewed is made by the editors with the help of advisers in the various specialties; arrangements are then made with reviewers. A sheet of instructions accompanies each book when it is sent to the reviewer.

Cover Photographs

Particularly good photographs that are suitable for use on the cover are desired.

THE HIGH-SPEED ULTROLAB[®] DILUTER

The LKB Ultrolab Diluter is one of the fastest and most accurate diluters on the market. It will siphon up a preset volume of a sample liquid and flush it out with a preset volume of a reagent at a rate of up to 1200 times an hour.

The Ultrolab Diluter can also be used as a dispenser, to dispense one or two reagents at the same high rate.

Each pump is permanently preset to deliver 10 different volumes, which can be selected by merely pressing a pushbutton. Three pumps are available

to choose from, giving in all a choice of volumes from 10 μ l to 3000 μ l. These are high-precision pumps, with an accuracy of $\pm 1\%$ and a reproducibility of $\pm 0.5\%$. Tight, leak-free operation is achieved by employing smooth, sapphire pump plungers.

Operation is simple. To change over pumps you just press a button and remove the pump, complete with reagent bottle. You can immediately begin dilution or dispensing for a different type of analysis by plugging in a spare pump with a new type of reagent. A convenient hand pipette and a foot pedal control are available as optional items.

Whatever range you're weighing in, Sartorius top-loaders are best to weigh it on.

Meet the top-loaders that carry a lot of weight, particularly with people who have important weighing work to do — the Sartorius Series 2250 Balances.

These dependable, extremely accurate instruments have net capacities ranging from 160 g to 5000 g, with accuracies from 1 mg to 0.1 g. All 2250's have all-digital readout and huge optical scales with large numerals for easy reading, even under adverse lighting. They have no discernible swing or deviation from the indicated weight, and all models in this series provide mechanical taring. Some models even feature automatic leveling systems, electrical output for external control or print out of results, and special tolerance weighing facilities. In short, there is a Sartorius 2250 top-loader to

meet virtually every non-analytical laboratory weighing situation, including direct weighing of unknowns and animals; rapid weighing-in of powders, liquids, granulated materials or fabricated parts; tolerance weighings; even below-balance weighings.

Choosing which model best suits your particular weighing requirements is probably the most serious problem you'll ever encounter with a Sartorius top-loader. The solution to that one is in our comprehensive new balance catalog. For your free copy, just write: Sartorius Division, Brinkmann Instruments, Cantiague Road, Westbury, N.Y. 11590.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

COVER

Nomarski interference-contrast micrograph of an aluminum-silicate mixture of stoichiometric mullite composition showing peritectic microstructure formed by slow cooling of a homogenized melt. Interpretation of such microstructures with the aid of diffusion couple technique results in a new $\text{SiO}_2\text{-Al}_2\text{O}_3$ phase diagram (about $\times 1200$). See page 69. [Ilhan A. Aksay and Joseph A. Pask, Department of Materials Science and Engineering and Inorganic Materials Research Division, Lawrence Berkeley Laboratory, University of California, Berkeley]

Leitz Diavert for transmitted light.

You can attach the Ploem vertical fluorescence illuminator in less than two minutes.

Introducing the first inverted microscope designed as an inverted microscope.

The new Diavert was engineered from the base up as a system designed to meet the special requirements of inverted microscope applications.

Leitz, in nearly a decade of development, made no compromises with the objectives of stability, convenience and versatility.

To begin with, the Diavert is exceptionally stable. That square shape is as solid as it looks. The base area is 627 cm². The basic mechanical structure consists of rigid aluminum castings.

And the Diavert is indeed convenient. For instance, the 164x160 mm stage is positioned low. You can see what you're doing when you manipulate specimens. Focusing knobs are also low. So your arms don't get tired.

The image moves in the same direction as the specimen. Reason: image-erecting optics. The transmitted light lamp moves with the stage so it doesn't have to be refocused when you change the specimen plane.

And long working-distance condensers, up to 64mm, give you plenty of room above the stage.

As for versatility, the Diavert is a building block system so you can add or remove or exchange any accessory in a matter of seconds.

As the result you can readily employ all the techniques of light microscopy: brightfield, darkfield, phase contrast, polarized light,

You can conveniently use any type of culture vessel with the Leitz inverted microscope.

differential interference contrast. It can also be used with the Ploem vertical fluorescence illuminator. The Diavert accepts a full range of photomicrographic equipment.

If you own a Leitz Ortholux II research microscope, you can interchange all Ortholux accessories. And you save the cost of buying them for the Diavert.

If an inverted microscope would be useful in your investigations, you should investigate the Diavert.

For a brochure, please write to E. Leitz, Inc., Rockleigh, N. J. 07647.

Checking lenses . . . straight line set-ups . . . aligning electronic parts . . . or ?

Lathe bed optical/ instrument benches.

If your work involves checking the parameters of lenses and lens systems, or the manipulation and alignment of experimental systems using lasers, optical, and electronic parts and similar devices, consider a Gaertner optical bench. It will provide the stability and precision you need—with a choice of options to meet your specific requirements.

Rugged. These benches are made of a special, massive casting with ribbed design for stability—treated and precision ground to assure permanent straightness of the guide ways.

Two basic lengths, 160cm and 120cm are offered. We can furnish any combination of these lengths, joined to provide extra long benches as needed.

Optical testing. For accurate testing of lenses, mirrors, and optical systems our Model L36ON precision optical bench assembly is ideally suited for measuring focal length, resolving power, distortion, astigmatism, curvature of field, coma, spherical aberration and lateral and axial chromatic aberrations.

Alignment. If your laboratory experiments involve precise, dependable and stable alignment of components, as for instance, laser or photometric systems, electron guns, breadboarding or prototype setups, you'll find a lathe bed bench indispensable. Or you can use the bench as a base for a scale comparator, a flame photometer, spectrophotometer, or similar instrumentation. **Ask for Bulletin 156-73.**

Rectangular flat bed optical/instrument benches.

You can select these Gaertner benches in three basic sizes, all with or without vibration isolation air-suspension systems: 2 meters x 57cm; 3'x4' or 4'x6'. They provide a large stable magnetic surface, yet are reasonably portable. With a variety of magnetic carriages and other accessories, these benches give you great flexibility for positioning, breadboarding and prototype set-ups—for holographic work, instrument experiment and design arrangements using folded optical paths, and more . . .

Vibration isolation. With the vibration isolation system you can support sensitive instruments such as spectroscopic systems, interferometers, a micro balance, etc. Also useful in photography and photogrammetry. The benches are used for many industrial applications as well as research. Example: in a steel mill to isolate delicate equipment for monitoring the chemical composition of the melt inside a blast furnace.

Unlimited holographic applications. Gaertner rectangular optical/instrument benches can be furnished with holographic components for use in information storage and retrieval, material studies, and other work in a broad range of fields where holography is being applied. Examples: (1) the study of internal stress in medicinal tablets to eliminate a problem with crumbling; (2) micro-holographic study of tissues from rats; (3) refractometer experimentation, (4) the investigation of the second harmonic generation of a laser, and many many more . . .

Accessories . . . plus an inexpensive liquid plate-holder. Gaertner offers a complete selection of optical bench accessories and component assemblies, including magnetic holders. The low-cost liquid plate-holder for real-time holography permits processing a plate without removing from the holder, eliminating repositioning problems. **Ask for Bulletin 156-72L.**

Double rod benches: inexpensive and versatile.

For less critical applications, you'll find a double rod optical instrument bench excellent. It is a relatively inexpensive yet sturdy and straight base for a variety of carriages and component assemblies. Available in 1, 2, and 3 meter lengths, with or without a linear scale.

These benches may be used for lens testing, determination of conjugate foci of lenses, or with microscopes for the measurement of dimensional changes of materials such as floor tile, paper, etc., in various environments. Medical researchers have used a double rod bench in developing special transducers for use in open heart surgery. With the bench supported over an

aquarium, they were able to precisely position samples and transducers within the tank.

Accessories. There's a complete selection of Gaertner optical/instrument bench accessories for all kinds of set-ups requiring alignment, positioning, linear and rotational movement of test pieces or components. Included are calibrated fine x-y and x-y-z motion stages, lift-off carriages, microscopes, light sources, holders, slits, collimators, and others.

For information on Gaertner lathe bed and double rod optical/instrument benches, **ask for Bulletin 156-73.**

Information.

Please request literature on any Gaertner instruments of interest to you. Or ask our recommendation for an instrument designed to meet your particular requirement.

One camera took all of these pictures and delivered them in seconds.

Chromatogram of urological specimen. Type 108.

Bone combs from Middle Ages. Type 52.

Photomicrograph of experimental galvanized coating. X100. Type 107.

35mm slide of muscle structure. Type 46L.

Damaged automobile piston. Type 55 positive/negative.

Lung with tumor. Type 108.

The new Polaroid MP-4 camera.

It's the one camera that couples speed with flexibility.

It fits practically any job you have because it lets you use 13 different Polaroid instant films in 4 x 5, pack or roll formats.

They give you exactly the records you need—in full color or black and white (fine-grain, high-speed, negative with matching positive, and even black and white transparencies).

And not one of them takes more than two minutes to develop.

The modular design of the new MP-4 lets you interchange cameras, film holders and lenses. Because the light arms are completely adjustable, it

can handle even the most difficult lighting situations.

And you can shoot at any angle or perspective because both camera mount and column rotate through a complete 360 degrees.

And you can't go much further than that. The MP-4 Multipurpose Land camera belongs in every laboratory and photo studio. It delivers in seconds what other photographic processes can take hours to achieve.

For more information or a demonstration, write to Polaroid Corporation, Dept. 26-254, 549 Technology Square, Cambridge, Mass. 02139. Or call collect (617) 547-5176.

Circle No. 38 on Readers' Service Card

Worthington Collagenase...

White fat cells, obtained by enzymatic digestion of parametrial adipose tissue as used in study of membrane mediated responses.

specifically blended for cell isolation.

In microbiological studies of animal cells, it often is desirable to isolate and separate the cells for further study. The researcher's need is to separate the cells from the connective and cementing materials without damaging the cells themselves.

Many researchers found that a natural mixture of digestive enzymes produced by a non-toxicogenic strain of the bacterium *Clostridium histolyticum* provided the separation remarkably well. The enzymes, without the toxin that many of the *Colstridia* produce, effectively digest away the materials connecting the cells into a tissue, but leave the cells themselves virtually untouched.

The enzyme mixture is named after its unique member, *Collagenase*. Worthington supplies Collagenase in several degrees of purity ranging from crude to highly-purified; researchers have generally found that the less purified material is more effective in releasing intact cells from tissues. The effectiveness, however, seemed to differ with different tissues, and it did not always match the quantitative differences noted in our assay labs.

A program was therefore initiated by Worthington aimed at correlating effectiveness of samples on specific tissues with results of our own biochemical assays. We enlisted the support of several dozen prominent researchers; they evaluated more than a hundred samples of regular production and specially prepared lots of Collagenase in their own studies.

Evaluation of these studies has enabled us to categorize our crude Collagenase into four different types which are blended and classified according to the specific tissues for which each is best suited. The four types are available as listed in our current catalog.

TYPE	CHARACTERISTIC	TISSUE BEST SUITED
I	Normal balance	Fat cells; Adrenal tissue
II	High Clostridiopeptidase	Liver, Bone, Thyroid
III	Low Proteases generally	Mammary
IV	Low Tryptic activity	Pancreatic Islet cells

The increasing use of Collagenase in cell isolation is encouraging. Credit for the program's success is due to the many researchers who cooperated so openly with their time and talent.

Your comments and interest are welcome. Additional information on this application of Collagenase and a copy of our current catalog are available on request.

Worthington Biochemical Corporation | Freehold, New Jersey 07728 U.S.A.

The Varian Techtron 635... more answers for less.

If your life science problems can be resolved by UV-Vis spectroscopy, chances are the 635 can do it. And for less—less time and trouble, as well as cost! So... what's your problem?

1. If you insist on accurate and reliable results from your routine analyses, you'd do well to select the high performance 635M with simple push-button operation and direct meter readout (recorder optional).

If it's clinical surveys with repetitive measurements of similar samples, the 635D is for you with 4-digit display of concentration. And this is only the start:

2. When your work load increases,

add this new versatile Auto-50 Sample Changer with its vacuum sample transfer...

3. or plug in the Digital Printer for recording results unattended.

4. Need to run multiple samples simultaneously or run kinetic assays? Then add this Auto-5 Cell Programmer with its multi-zero and multi-range capabilities.

5. Want to follow thermal denaturations or other reactions sensitive to heat? Just add this Temperature Read-out Accessory.

6. Monitoring reaction velocities? Analyzing for components of mixtures? Then let our Wavelength Programmer

do it automatically, measuring at up to four wavelengths sequentially. Or comparing titration curves? Pin-pointing isosbestic points? This Wavelength Programmer scans repetitively also!

7. And to overlay your scans, you'll want our new X-Y Recorder.

8. Or perhaps you must quantitate proteins in gel separations. Our Gel Scanner does it better and faster.

Select whichever you need... all reliable, practical solutions... at reasonable cost. At Varian we design *simpler* ways to answer your life science problems.

For our new 635 brochure, circle Reader Service No. 31.

Flameless Atomic Absorption... trace metals in micro samples.

If your concern is preserving environment or conserving life, you would do well to investigate the new flameless AA spectroscopy as performed by Varian Techtron's Model 1200 with Carbon Rod Atomizer. This new analytical tool detects trace elements in picogram (10^{-12} gm) amounts, often 200 times as sensitive as conventional flame absorption. The miniature tube furnace atomizes microliter samples in seconds.

Trace metals in body fluids or tissue, in natural waters or effluents, in soils or produce... all are determined with ease, usually with minimal preparation. Toxic elements in foods, cadmium in hair, metallic particulates in air... all may be monitored precisely. This flameless AA is often the only practical method, especially where sensitivity or sample volume is limited. (You can still switch back to flame absorption whenever you wish). Ask for brochures on this high performance Model 1200 AA and the unique Techtron CRA.

Reader Service No. 32.

The Cary 118...for microliter samples and much more.

Here's an answer for the dilemma so common to biochemists: UV absorbance measurements of biological compounds with only micro quantities available.

The Cary 118 measures samples as small as 20 microliters. The beam can be masked down to 1 mm diameter without degrading performance!

The Cary 118 performs better in the UV range than any other spectrophotometer available... with the highest photometric accuracy of all. Extending into the far UV, it measures with ease the concentration of polypeptides or saturated steroids.

The Cary 118 makes precise difference measurements for investigating conformations of macromolecules and provides derivative spectra to detect overlapping bands.

And to the Cary 118, with its calibrated zero suppression, high absorbing samples are no problem.

This superior Cary 118 performance may be attributed to both high energy throughput and negligible stray light. These are attained by high intensity sources, dual prisms with high UV dispersion, and the unique Cary V-beam geometry that focusses more energy on the sample and uses less reflecting surfaces.

The versatile Cary 118 adapts for repetitive scans, multiple samples, fluorescence excitation, scattered transmission, and more. As for convenience, it's unsurpassed: digital display of concentration, %T or absorbance (seven ranges)... and, indispensable for overlaying spectra for comparison of titrations or slow kinetic changes, a digitally coupled scan and chart drive.

Yes, to study macromolecules in micro quantities, the Cary 118 is the logical, and often the only, choice.

For information, circle
Reader Service No. 33.

For analysis of difficult samples... two chromatographs you can trust.

For the most difficult GC analyses... Model 2100

Model 2100 can help you operate easily and efficiently with difficult samples such as you encounter in analyses of drugs of abuse, pesticides, steroids, pharmaceuticals, and other compounds which are metal-sensitive.

Here's why.

Model 2100 has an all-glass system and on-column injection, so sensitive compounds do not contact metal. Negligible dead volume provides superior resolution and sensitivity. The large (3000 cubic inch) U-column oven has uniform heat distribution and precise temperature control, even when temperature programming. And Model 2100 is available with an Automatic Linear Temperature Programmer which automatically provides reproducible column-oven temperature programs.

A solid state dual and differential JFET electrometer is standard on all models. And the ability to run as many as four detectors and four U-columns simultaneously gets you maximum productivity and operating flexibility.

*Reader Service
No.35.*

For the most difficult LC analyses... Model 4200

Model 4200 gives you more analytical power for complex samples than any other LC system.

It's the only LC system that provides all these major advantages: 5000 psi injection, 5000 psi pumping system, multi-linear solvent/flow programming (MLSP), and a choice of detectors, including Variscan™ the detector that makes it possible to detect and analyze any compound that absorbs in the UV-Vis, from 210 nm to 780 nm.

The precisely controlled high-pressure (5000 psi) pumping system assures accuracy and reproducibility of peak areas and retention times. This system also permits you to utilize the full resolution and speed of MicroPak™—the most efficient LC columns.

For extraordinarily difficult samples, you can set the MLSP to form solvent gradients of virtually any shape—linear, nonlinear, convex or concave, and of any duration from one minute to six-plus days.

Combine Model 4200 with the Variscan UV-Vis detector and you can make LC measurements at the maximum absorption wavelength of compounds that absorb in the entire UV-Vis spectral region from 210 to 780 nm with no sacrifice in efficiency. And, whenever you wish, you can quickly stop flow, push a button, and obtain absorption spectra of individual peaks in your chromatogram.

There's no other LC system anywhere that can even begin to compare with it. Details, including chromatograms and specifications, are yours for the asking.

Just circle Reader Service No.34.

**Varian Instruments for
Life Science Research & Analysis**

Our E-Line Spectrometer owners are the best advertisement we have.

We don't spend a lot of money advertising our E-Line Spectrometers. We don't need to. Our owners do it for us, by word of mouth, with their consistently glowing recommendations, and for most prospective ESR users, that carries more weight than all the advertising in the world. What do our owners say about us? The most typical comments praise our performance. That's because we make the most sensitive ESR systems in the world. Our owners laud our reliability and versatility, too. And just look at some of the areas they're using spectrometers to investigate.

Organic Chemistry: Free radicals in solution, kinetic studies, triplet states.

Physical Chemistry: molecular structure, relaxation studies, exchange phenomena, quantitative studies.

Inorganic Chemistry: transition elements, electronic wave function.

Analytical Chemistry: impurity studies, drug detection.

Solid State Physics: impurities in semi-conductors, conduction electrons, energy transfer.

Biological Sciences: Nitroxide spin labeling of macromolecules, protein investigations, irradiation damage.

What's more, Varian's E-Line Spectrometers are backed by an on-going program of applications development, the best and most complete such program in the industry. That's something our owners really appreciate.

But don't take our word for all this. If you'd like to hear about our ESR Spectrometers first hand from an E-Line owner, simply call your local Varian salesman. He'll be happy to set it up.

In the meantime, send for a copy of our E-Line Brochure. *Circle Reader Service No. 36.*

Inside the EM-360 NMR Spectrometer

An NMR Spectrometer is only as good as its component parts, and that makes the EM-360 the best low-priced 60-MHz system in the world.

Let's start with the heart of any NMR system, the magnet. We make our own—always have. That's because we feel the magnet is the most important part of an NMR system, and we simply don't trust its manufacture to anyone else. We make them well, too. We're the largest manufacturers of precision electromagnets in the world. Each year we make as many as all the other manufacturers combined. This means we have not only the capability to produce top-quality magnets, but also the expertise that only comes from years of research in the field, and it's all been brought directly to bear on the EM-360. Precise temperature control and magnetic shielding isolate the magnet assembly from environmental changes and insure maximum field stability. The magnet is castor mounted and can be positioned to suit individual requirements. No special services, i.e., cooling water, etc., are required. All you need to activate this magnet is 150 watts of 110 volt ac power.

Now let's take a look at the EM-360's radio frequency section, the electronics that supply the rf signals used to irradiate the sample, detect the NMR signal sample, and feed it to the recorder. Varian's been making NMR spectrometers longer than anyone. We made the first one, and we've continued to improve our electronic design ever since. It shows up quite nicely in the simple, efficient integrated circuitry used in the EM-360. On the EM-360, rf field is controlled directly from the console and is continuously variable from 0.005 to 0.5 milligauss. For routine spectra, we've indicated a standard setting. For more

exacting work, we've allowed you to take complete control. The EM-360 probe uses a 5-mm sample tube, the same size used by the vast majority of NMR spectrometers.

Last, but far from least, the EM-360 uses a big 11 by 17-inch YT recorder to give you the biggest results around.

This has been just a brief look inside the EM-360. Send for a brochure on the system and take a look at the outside, as well. *Reader Service No. 37.*

Varian Associates
Instrument Division,
611 Hansen Way,
Palo Alto, California 94303.

This is a new P.A.G.E.

Pharmacia Gel Electrophoresis System for polyacrylamide gradient electrophoresis and other P.A.G.E. techniques

The complete system

Full capabilities for the new pore gradient electrophoresis technique, two dimensional studies, gel rod electrophoresis.

Polyacrylamide gradient gels PAA 4/30

Convenient ready-to-use gradient gel slabs give extreme resolution over the whole range 50,000–2 million MW. Self-limiting migration concentrates the zones after separation by molecular size.

Gel electrophoresis apparatus GE-4

4 gel slabs, 12 samples on each, or 16 gel rod capacity. Robust moulded construction with built-in cooling system. Full range of accessories for all applications.

Electrophoresis power supply EPS 500/400

Compact, all solid state. 0–400 mA constant current, 0–500 V constant voltage with automatic cross-over. Maximum effect 60 W. Full personnel and instrument protection. Available 1974.

Gel destainer GD-4

Electrophoretic or diffusion destaining of slabs or rods in a single operation. Twin cells. Active dye removal and solvent circulation. Results can be inspected at any time.

Destainer power supply DPS

Compact, reliable, all solid state. Push-button selected constant voltages 12, 24, or 36 V. Timer controls electrophoretic destaining up to 90 minutes.

Find out more about the Pharmacia Gel Electrophoresis System from your usual supplier of Sephadex[®] and Sepharose[®].

Should your next step be a Forma forced draft CO₂ incubator?

All Forma forced draft CO₂ incubators are ideal for tissue culturing with UN-I-TROL direct CO₂ setting and KWIK-PURGE automatic CO₂ tension recovery. A self-contained air supply eliminates the need for a lab air source. Stainless steel unitized construction is standard.

Step up to Forma. Call or write today for further details.

Forma's new reach-in incubator provides as much incubation space as a small environmental room (29 cu. ft.), with all the convenience features of smaller incubators. A digitally set temperature controller (standard) allows temperature set point control within 0.1° C. Direct dial Rh is standard. Air flow is horizontal, eliminating desiccating effects.

The model 329 is specifically designed to control temperature at 37.5° C, humidity at 98%, and CO₂ tension between 0% and 20%. Temperature range is 5° C above ambient to 60° C, uniform to $\pm 0.25^\circ$ C.

Model 329 D is 329 times two. 13 cubic feet of tissue culture space, with separate controls for each chamber. The SAF-A-LERT alarm sounds should the unit deviate from its set temperature. (just like its little brother.)

HOTTEST TEACHING MACHINE IN SCIENCE TODAY

It looks different. It is different. It's totally designed for science teaching. Academic StereoZoom Microscope by Bausch & Lomb lets science students relate to the specimen being studied without having to take a course in microscopy first.

This unique, Bausch & Lomb microscope combines stereovision with an exclusive

zoom magnification that makes for a natural relationship between the student and the specimen. Scanning the field at low magnification or zooming to a specific detail at higher magnification is as non-technical as watching a quarterback on TV. And list prices for this American-made instrument start at \$151.*

There is no longer an illumination problem. The turn of a knob allows selection of reflected light, transmitted light or a combination of the two, and it uses just one light bulb!

These new instruments are well built, with every safeguard to prevent damage to assure long, maintenance-free, lifetime use.

Write for the new catalog 31-2395 and our free demonstration offer, today.

**40 000 scientifiques
achètent chaque mois
'La Recherche'
10 000 d'entre eux
ne sont pas français**

If LA RECHERCHE has an international readership, it's probably simply because its contents is international. You'll find well known French authors in LA RECHERCHE :

E. Baulieu, F. Jacob, P. Jacquinet, F. Morel, X. Le Pichon, A. Leroi-Gourhan, L. Lliboutry, J. Monod, C. Ropartz, Ch. Thibault among many others. But you'll also find articles by H. Alfvén, J.E. Cleaver, Hong Yee Chiu, Th. Dobzhansky, G. Natta, O. Morgenstern, C. Ponnampertuma, D.W. Sciama, J. Tuck, S. Uyeda...

Enough name-dropping. Distinguished names are not sufficient to make a good publication. (Some of our predecessors prove this.) Written by scientists for scientists, LA RECHERCHE covers everything from biochemistry to astrophysics. But it does not stop at doling out monthly slices of a cake baked of arbitrarily selected "good" articles.

You see, we think that LA RECHERCHE is the best interdisciplinary monthly.

But, as its publishers, we have our prejudices.

What do you think? Even if your French is a little rusty, you can judge for yourself - free of charge - over a period of 3 months. All you need to do is fill in and return the coupon below.

Mail to LA RECHERCHE, 4, place de l'Odéon, 75006 Paris, France.

I wish to receive the next 3 issues of LA RECHERCHE on a trial basis. If interested, I'll settle your invoice on receipt of the third issue and benefit from the special subscription rate of \$ 17 instead of the usual \$ 23 for a year's volume of 11 issues. Otherwise I'll keep the 3 issues received at no charge to me.

EUSN

Photomicroscope III—there's room at the top because of what's in the middle and the bottom.

The camera and the controls are completely integrated. The completely automatic 35mm camera of Photomicroscope III is built into the microscope stand for ease of operation and stability. All the controls are built into the base for ready accessibility and compactness. So the top is free for the addition of whatever auxiliary documentation or observation equipment you may desire—such as the unique Zeiss Glarex Projection Screen, shown below.

More light on the film. With Photomicroscope III you can direct 98% of the light onto the film and still have enough for automatic exposure detection with no change in the setting for film sensitivity. This is particularly advantageous for fluorescence and polarizing photomicrography.

Now, an automatic electronic flash . . . a first in photomicrography. This built-in flash unit eliminates reciprocity failure and vibration problems and the need for color temperature compensation. And you still have, of course, the widest choice of illumination equipment for all microscope techniques in both transmitted and reflected light.

Much more. Get the whole story by writing Carl Zeiss, Inc., 444 Fifth Ave., New York, N. Y. 10018. Or call (212) 736-6070.

Qtam? Sno

Doesn't anybody in
the computer business
speak English?

The computer business has created its own
language.

“Computerese.”

It helps computer people communicate with
each other about computers. But it doesn't help
them communicate with other people.

We want to make computers easier for you
to understand.

Because the difference between the right
and wrong way of using them can mean a lot to the
profitability of your company.

So we're going to dispense with computerese
and talk a language businessmen can understand.

bol? Bomp?

Like \$\$\$\$\$\$.

Our computers cost a lot less. Often 50% less than the big, complicated computers most companies are using now.

And the way they solve problems is simpler. More reliable. Easier to work with.

Simple? Reliable? Inexpensive?

What kind of computer company would dare utter such strange things?

Data General.

The world's fastest growing maker of small computers.

You probably haven't heard of us before. But you're going to be hearing from us again.

A lot of what you hear will be hard to believe. But it won't be hard to understand.

BREA

Retention efficiency for
WHATMAN glass fiber filters.

ASTROUGH

in High Efficiency Sub-Micron Filtration!

WHATMAN® Ultrafine GF/F...

- It's a unique glass fiber depth filter

Whatman's unique new GF/F glass fiber paper retains particles in liquids as small as 0.7 μm on initial particle penetration with 98% efficiency. It offers very high loading capacity, yet provides rapid filtration speeds at the same time! And, this new depth filter is very low-cost when compared to membrane filters. GF/F collects particles down to 0.01 μm in air filtration.

GF/F papers are 100% borosilicate glass micro-fibers containing no binders or additives. They are physically stable to temperatures up to 500°C. And because no binders, organic or inorganic additives are used, the filters are inert chemically, biologically and biochemically.

An unusual combination of properties make GF/F ideal for many critical applications. Fine capillary structure allows the paper to absorb large volumes of liquids. Since the paper is inert, it does not influence the concentration of low molecular weight solution components. And as the paper can be rendered completely transparent, conventional microscopy can be used for examination of the particulate matter retained.

- And an excellent membrane pre-filter

Why not take advantage of glass-fiber filtration in your own work? Typical applications include: cell harvesting, scintillation counting, clinical sampling, biochemical filtration, air and water pollution monitoring, prefiltration. Glass fiber paper is also used as a support material in chromatography.

Reeve Angel offers industry's broadest line of low-cost glass fiber papers WHATMAN:

- GF/A — general-purpose paper with high flow rate. Retains particles down to 1.6 μm and smaller.
- GF/B — thickened version of GF/A with very high capacity for fine particles (1.0 μm and smaller) without clogging.
- GF/C — is the standard paper for the collection of suspended solids in potable, natural and industrial waters.
- GF/D — dual purpose, rapid flow rate paper for use as membrane prefilter, and as a high flow/high efficiency general-purpose laboratory filter. Retains particles down to 2.7 μm and smaller

Dispense and dilute any reagent with 0.1% precision... many models... 50% lifetime guarantee.

1.

Now L/I's REPIPET® dispenser comes with a convenient, extra wide-mouth low-profile two-opening bottle. Take your choice: pour reagent into the extra wide mouth. Or, leave your dispenser permanently in place on one opening, use the other opening to refill with reagent. Holds 1000 ml. Dispenses any analytical reagent except HF with 1% accuracy, 0.1% reproducibility. Stocked in 1, 5, 10, 20 and 50 ml sizes. Prices start at \$59.50.

Circle No. 17 on Readers' Service Card

REPIPET Dispensers with 2-opening container.

2.

Universal REPIPET dispenser fits any container up to 5-gallon carboys and dispenses any analytical reagent. Simply cut the tubing to fit into the lower extremity of your container and you'll get every bit of reagent out. Stocked in 1, 5, 10, 20 and 50 ml sizes. Prices start at \$75.00.

Circle No. 18 on Readers' Service Card

3.

The REPIPET Dilutor is the best on the market for under \$125. Why? Because it's precise and simple to operate. Accuracy is 1%, reproducibility 0.1%. Only glass and Teflon® contact reagent, so you can safely use any reagent except HF. All L/I Dilutors are self-cleaning, minimizing chances for cross-contamination. Square bottle provides firm base. A wide variety of tips is supplied at no charge. Many models to choose from 1 to 50 ml. Prices start at \$109.50.

Circle No. 19 on Readers' Service Card

UNIVERSAL REPIPET Dispenser.

REPIPET Dilutor.

4.

AUTO-REPIPET® Dispenser and Dilutor. Many times, two hands aren't enough when you are dispensing reagents into capped containers—or when you need the use of your hands to position equipment. The AUTO-REPIPET Dispenser or Dilutor uses your foot as a third hand, dispensing any reagent except HF with 0.1% reproducibility and 1% accuracy. Simply step on the air-activated foot pedal and the instrument dispenses automatically, leaving both of your hands free for other purposes. The safest way ever for dispensing corrosive reagents. Available from stock in 1, 5, and 10 ml sizes for dispensing or diluting. Prices start at \$160 each complete.

UNITRON STUDENT MICROSCOPES with Professional Features

Mr. Sucy, is anyone using microfiche readers in teaching?

Jim, where can I apply for Federal funding of my research on picture-taking as a guidance tool?

What is the evidence, Jim, for increased retention with audiovisual aids?

Sucy, I need to set up a course in non-destructive testing. What do I do?

Does Kodak have any suggestions on how our professional society can reach its members with packaged training?

Where can I buy a Kodak visualmaker kit?

Service to education

James G. Sucy is the name. Manager, Education Markets Services, is the title. Address: Eastman Kodak Company, Rochester, N.Y. 14650. Phone: 716-724-4501. Function: to find the person in the best position to field any teacher's question that relates any Kodak product or service to the educational process. "Teacher" covers professor, educator, trainer, instructor—whatever you think it should cover. Patterns discerned in the questions will shape next year's and next decade's Kodak products and services.

What type of programs do you have for military trainers?

Does Kodak have any workshops for teachers?

Can you help me plan a new projection room?

DO YOU HAVE ANY RECOMMENDATIONS ABOUT MAKING SLIDE-TAPE INSTRUCTIONAL UNITS?

Can you give us some information about using microfilm in our school library?

What services does Kodak have for junior high schools?

Do you know of any schools where a student of mine can learn to be a photographer?

Please send me some information about photography at the grade-school level.

HOW DOES KODAK ANALYZE AND PLAN TRAINING PROGRAMS?

I'd like to talk to someone about computer-assisted instruction for our industrial training.

Do you have any information about careers in photography?

Do you have any information to help me start a high school photo club?

Does Kodak have any films for loan about picture-taking?

Would you send me information about the flexible classrooms in your new education center.

Should I use rear or front projection in our new building?

Our school of dentistry is individualizing. Do you have any information to assist us?

How can I make my own slides for my biology class?

Solubilizes better than
anything available today.

WARNING
FLAMMABLE. POISONOUS.
CONTAINS STRONG BASE.
DO NOT TAKE INTERNALLY.
KEEP OUT OF EYES.
DO NOT PIPETTE BY MOUTH.

Causes severe burns. Avoid contact with skin, eyes and clothing.

FIRST AID: SKIN—Wash initially with generous amounts of water, then with a mixture of alcohol and water. Final washing should be done with soap and water. **EYES**—Wash with generous amounts of a weak boric acid solution or water. Call a physician.

KEEP BOTTLE TIGHTLY CLOSED. FOR LABORATORY USE ONLY. KEEP FROM CHILDREN.

Plug our pyrolysis system into your inlet

If you would like to pyrolyze solid samples into volatile breakdown products, here's a simple system to help you do it. The Hamilton Pyrolysis Sampling System has a temperature control unit, a gas control unit, and a

heated line with an injection needle that injects directly into your chromatograph's inlet. Scrapings or cuttings in milligram sizes are pyrolyzed at controlled temperatures up to 800°C with times and temperatures that are

repeatable. The simple solution for solid sampling . . . for literature write to Hamilton Company, Post Office Box 17500, Reno, Nevada 89510.

HAMILTON 

Sources for nuclear instrument calibration

All nuclear counting systems and most radio-analytical procedures require the use of calibrated reference sources to determine the efficiency of sample preparation, the absolute counting efficiency of the detection system, or to provide a convenient check on the proper performance of the instruments.

In the current catalog New England Nuclear lists over 100 reference sources of the most commonly used radionuclides—alpha, beta, gamma, simulated, electron, X-ray, and liquid scintillation; calibrated and uncalibrated; in rod, disc, and vial form. Each calibrated reference source is accompanied by a Certificate of Radioactivity Calibration which describes the method of fabrication and the method of assay and lists an analysis of the errors associated with the calibration measurement.

Orders for custom reference sources of other radionuclides are welcomed—we can supply sources of over 100 different radionuclides. Send for our free catalog.

Circle No. 60 on Readers' Service Card

after a lengthy discussion of the fact that a garbage collector can be replaced more easily than, say, a brain surgeon, they say, "Within science some men are more easily replaced than others. . . . It may not be necessary to have 80 percent of the scientific community occupied in producing 15 or 20 percent of the work that is used in significant scientific discoveries, if perhaps only half their number could produce the same work." Thus the fact that some men could be replaced becomes an indication that the work could be done even if these men were removed from the work force *without being replaced*.

Faulty logic is apparent in the introduction of evidence that a great deal of work in physics is not cited at all. Even if "cited" is equivalent to "used," this evidence is irrelevant to the main thesis. To say that some obscure physicists do not contribute is not to deny that many others do contribute. Obviously, in physics as in garbage collecting or sociology, some workers are unproductive, and that was true even when we had one-tenth as many physicists as we have today. It might be more relevant to see if the *percentage* of uncited work has increased as the number of physicists has grown. In any event, because of the way the grant system works, it is unlikely that unproductive physicists absorb much of our research budget.

Many factors that could have a bearing on Cole and Cole's interpretation of their data are either ignored completely or else dismissed by the introduction of some questionable hypothesis.

1) They do not mention that some fields of research are more popular than others. A person working in acoustics will receive fewer citations than a worker in high energy physics.

2) The possibility of more than one "generation of influence" on a paper is dismissed with a hypothesis that a search of further generations would not add many names that "appear more than once." But these names are the very names that the Ortega hypothesis is all about. It seems odd to set out to test a hypothesis concerning the effects of obscure researchers, then to say we do not have to look very far for these effects because these men can be replaced, and finally to say that we could therefore have progress without them or without any replacements for them.

3) Although Ortega specifically re-

ferred to "experimental science," Cole and Cole make no distinction between experimental and theoretical work, and they use the words "work" and "ideas" interchangeably. Consider a 1968 paper by Gell-Mann, Oakes, and Renner (1) in the 1971 *Science Citation Index*. It cited 26 papers; all were by theorists. A check of the cited papers shows that almost all of the papers cited in them were also by theorists. The only references to experimental work were "second-generation" citations of books or review articles. But review articles were excluded from Cole and Cole's study because they would "distort . . . [their] results." Thus their methods must lead to the conclusion that Gell-Mann *et al.* are not influenced by experimental results!

Recognition of the difference between theory and experiment makes the "Pointilliste" analogy more understandable. We may say that experimentalists fill in points on the canvas, while theorists try to recognize the picture that emerges. Eventually a theorist will say, "Aha, it's a giraffe (or an octet)." Maybe the theorist does not need every point in order to recognize the giraffe; maybe some experimenters fill in more points than others; maybe some workers are filling in some obscure cloud in the background instead of parts of the giraffe. But if too many points are missing, the picture is unrecognizable; theorists are already asking for points that are not being filled in because of budget limitations. It is difficult to decide, before the picture is recognized, which points will be significant, and thus where to place our dwindling resources, but it must be better to base the decision on analysis of the physics rather than on mere numerology.

Being intrigued by the hypothesis of Cole and Cole that the "contribution to scientific progress" of an individual can be determined by "citation analysis," I decided to engage in the exercise in ego gratification that this hypothesis suggests. Looking up my own work in the 1972 *Science Citation Index*, I found, among other things, two references to a humorous letter I wrote to the editor of *Physics Today* (1) about what physics would have been like if the

It amounts to the same thing. Everytime.

With our new Micro BIOPETTE semi-automatic pipettes, you set the lambda gauge, and then deliver exactly the same amount of liquid everytime (until you re-set the lambda gauge). It's accurate, and more reproducible than hand pipetting.

All of which make our Micro BIO-PETTE ideal in applications where accuracy and reproducibility are musts.

Our Micro BIOPETTE pipette is available in two size ranges. The 100 lambda size provides 3 volumes: 50 ul, 70 ul, and 100 ul. The 30 lambda size provides 4 volumes: 10 ul, 15 ul, 25 ul, and 30 ul. In addition we offer two other BIOPETTE pipettes to complete our line of semi-automatic pipettes: 0.2 ml and 1.0 ml.

For more information on our complete line of semi-automatic pipettes write us. Schwarz/Mann, Division of Becton, Dickinson and Company,  Mountain View Avenue, Orangeburg, New York 10962.

present mechanisms for research funding and publication had existed in the time of Copernicus and Kepler, making this letter one of my "major contributions to scientific progress" for that year. These references were due to two letters to the editor that were critical of mine. Nevertheless, they provided me with two citations, just as this letter will provide a citation for Cole and Cole. Hence, if a couple of more critical letters are published on the article by Cole and Cole, their work can, by its own standards, be said to have contributed about as much to scientific progress as my joke about Copernicus.

ROBERT J. YAES

Department of Physics,
Memorial University of Newfoundland,
St. Johns, Newfoundland, Canada

References

1. R. J. Yaes, *Phys. Today* **24**, 11 (December 1971).

The criticisms of our article fall into two categories: (i) Citations are an inadequate way to measure the quality of scientific work or intellectual influences on it; and (ii) the conclusions we reach concerning the size of science are not warranted by the data.

First consider the specific criticisms that are made of the use of citations.

1) The number of citations received by an article is dependent upon the "popularity" of the specialty (McGervey). This is only partially true. The sheer size of a field is not, in fact, closely related to the number of citations papers receive. While large specialties have more participants, they also have more literature to draw upon. Papers published in the larger specialty of solid-state physics, for example, do not receive more citations than those published in the smaller specialty of high energy physics. Further, McGervey assumes that the popularity of a specialty has nothing to do with the current opinion by scientists of the relative importance of work done in that specialty. Is acoustics merely a less popular specialty than high energy physics, or does high energy physics, more than acoustics, address a set of questions which are seen by physicists as more central to the advance of physics in general?

2) Experimentalists "fill in points on the canvas, while theorists try to recognize the picture that emerges" (McGervey). Two things are implied here: that experimentalists make many minor (infrequently cited) discoveries that

contribute to the syntheses of the theoreticians and that theoreticians frequently do not cite the work of experimentalists that they have used. Important experimental work and technical innovations are frequently cited. For example, the most cited scientist in the 1971 *Science Citation Index* (SCI), O. H. Lowry, is cited for the development of a technique. Also consider the paper by J. H. Christenson *et al.* (1) reporting the violation of CP (charge and parity) conservation. In the first 5 years after it was published, this article received a total of 369 citations. Although Christenson, a graduate student at the time, was the first author, the two senior authors, J. W. Cronin and V. L. Fitch, received a total of 261 and 160 citations, respectively, to other papers on which they were the first author. On the matter of influential work going uncited, this certainly happens in *specific* papers. What is important, however, is whether or not there is significant work which received few or no citations in the entire body of literature. One only has to consider the example used by Goudsmit himself. Although Fellgett and Jacquinot are not cited by Becker and Farrar, Fellgett received 33 citations and Jacquinot 42 (not counting self-citations) in the 1972 SCI. These totals would put them in the top 10 to 15 percent of all scientists. Although any one paper may fail to cite a paper that has been influential in its genesis, the critical point, which is missed by Goudsmit, is that the probability of an important paper going uncited in the entire body of literature is low.

3) One of the most frequent criticisms of the use of citation counts to measure the quality of work is that it is impossible to tell the difference between a "positive" and a "negative" citation. This criticism is based upon an incorrect definition of high-quality work. "Correctness" is only one of the criteria we use in evaluating scientific work. Much trivial work is "correct," and much important work turns out in historical retrospect to have been "incorrect." If we take Kuhn's (2) argument seriously, then the work of most of the great figures in the history of science was in a sense "incorrect." A paper which is important enough to receive a large number of critical citations is probably a significant contribution. Why would a large number of scientists waste their time pointing out a trivial error? In fact, they do not.

Papers which are trivial and receive critical citations will not accumulate large numbers of citations. Thus, Yaes' letter, which received two critical citations, is not, even by our own rough empirical measure, a significant contribution.

4) Counting citations in an inadequate way to evaluate individual scientists when tenure or other similar decisions are made. We cannot emphasize strongly enough that we totally agree with this point. Nowhere have we ever suggested that citations be used as a basis for rewards. Sociologists use citation analysis to study the *community* of scientists, not individual scientists per se. In any large aggregate of scientists there will be a relatively high correlation between the number of citations received and other methods of evaluation. There will always be individual cases, of course, where the rough statistical measure is inaccurate. Using citation counts to determine the future of a scientist's career would be committing the "fallacy of misplaced concreteness," would be reifying the statistical indicator, and would be grossly unfair to the individuals involved. Although counting citations is indeed a rough way to measure quality and influence, it has allowed us to address a whole range of substantive problems which, heretofore, were not negotiable because there was no adequate measure of research performance. Max Delbruck was well aware of the need at times for adopting less than perfect measures, as long as the scientist is aware that his measures are crude. His "principle of limited sloppiness" (3) does not, of course, excuse muddled thinking or poor logic. But his idea shows an acute awareness of the processes by which knowledge advances at various stages in the development of disciplines.

Finally a word about criticism by some natural scientists of work in the sociology of science. When a physicist publicly criticizes the work of another physicist, he is usually advised to be at least somewhat familiar with the literature on the subject of debate. When some natural scientists publicly criticize the work of sociologists of science, they do not appear to be familiar with literature on the topic. The criticisms about citation counts in the letters here are a case in point. There is now a substantial body of literature on the methodological problems involved in using citation counts. Virtually all criticisms raised in these

letters have been analyzed in some detail in this literature. Critics of citation analysis have a responsibility to familiarize themselves with this literature.

The second criticism of our paper suggests that even if most scientists are indeed rarely cited (accepting this indicator of influence as valid), this does not mean that scientific progress would be unaffected by a reduction in the number of scientists. Consider McGervey's implicit assumption that, since all research scientists might contribute some slight piece of relevant knowledge, they are therefore deserving of support. In a world in which resources were unlimited, we too would be in favor of the society supporting anyone who wanted to be a scientist. Science is certainly an intrinsically more interesting and worthwhile endeavor than many others. Unfortunately, we live in a world in which there is a limitation on available resources. In such a situation, rather than bemoan the sad state of science, it is the responsibility of the scientific community to consider how the limited resources we do have can be most effectively utilized.

Nowhere in our article do we suggest that there should be any cutback in the level of spending for scientific research and development. Our findings raise the issue, however, of whether limited resources might best be concentrated in support of the relatively small number of scientists who have the highest probability of making significant discoveries. We hypothesize that such a policy would not bring about a decline in the rate of scientific progress. We do not claim to have proved this conclusively. We claim to have presented enough data in support of hypothesis to merit its further consideration.

HIGH
PERFORMANCE

absorbance monitor

The ISCO Model UA-5 absorbance monitor gives you the high sensitivity, stability, and response speed required for high speed, high pressure chromatography — plus the wide absorbance ranges and specialized flow cells required for conventional chromatography, density gradient fractionation, electrofocusing, and gel scanning. Stationary cuvettes allow recording of enzyme and other reactions.

High sensitivity. 8 full scale absorbance ranges from .01 to 2.0A, plus %T. **13 wavelengths** include 254 and 280nm supplied in the basic instrument; 310nm, 340nm, and 9 other wavelengths to 660nm are available at low cost. Options include a **built-in 10cm recorder**, a **Peak Separator** to automatically deposit different absorbance peaks into different tubes, and a **multiplexer-expander** which allows monitoring of two separate columns or one column at any two wavelengths. Automatic 4X scale expansion prevents oversized peaks from going off scale.

The current ISCO catalog describes the Model UA-5 as well as ISCO fraction collectors, metering and gradient pumps, and additional instruments for chromatography and other scientific research. Your copy is waiting.

Social Experiments: Promise and Problems

Major experiments with social policy are under way. For example, the Office of Economic Opportunity's 3-year negative income tax experiment in New Jersey is in its final phases. The government is sponsoring a health insurance experiment to see how the use of health services is affected by the extent to which the patient shares the cost of health care and a series of experiments with housing allowances to see how such allowances affect the demand for and the supply of housing. In education, experiments with performance contracting and with new incentives for parents and teachers have been completed.

The new social experiments were responses to the frustration of those considering new policies who found themselves unable to answer the question: How do you know what will happen? The idea sounds simple, but the new tool is exceedingly tricky and hard to use skillfully.

First there are design dilemmas, some of which arise from the conflict between the desire to obtain valid, reliable results and the equally urgent desire to obtain results quickly and at a low cost. Then there are implementation dilemmas. To get a "clean" test of a new policy, it might seem best to have the policy spelled out in great detail in advance and have expert managers follow the rules to the letter. Allowing local communities to innovate as they go along, and perhaps change the whole intent of the policy, would mess up the experiment. On the other hand, if the policy being tested becomes a national program, it will be carried out by people with their own ideas and their own administrative strengths and weaknesses. Thus the "clean" experiment may turn out to be an unreliable predictor of what will really happen.

There are dilemmas attached to evaluation itself. Good evaluation is not possible unless it is built into the original design of the experiment and unless the evaluators are fully familiar with the details of the operation. On the other hand, if the evaluators are involved with the project from the beginning, can they remain objective? There are also timing dilemmas, for if the results of social experiments are to affect decisions, they must be available when the decisions are being made. Unfortunately, politicians rarely get excited enough about a problem to finance an experiment until they are nearly ready to make the decision. Then they want immediate results. But a "quick and dirty" experiment may be worse than none.

Moreover, there are difficult moral questions associated with experimenting with people. Finally, there is a series of dilemmas having to do with openness of experiments. For example, how can the privacy of the participants in the experiment be protected? If experiments—and indeed other types of social science research—are to continue, a way must be found to protect the privacy of respondents.

It is too soon to draw substantive conclusions from most of these social experiments, but something can be said about the method itself. Clearly experiments are feasible when the treatment is a simple one, such as a change in tax or a payment schedule, and when the outcome is measurable behavior of individuals, such as hours worked or dollars earned. It is still an open question whether more complex experiments are feasible.

Experiments can be an important tool in improving information for decision-making, but we know enough about experimentation now to know how hard it is to do it well. If great care is not taken to make current experiments as useful and as sensible as possible, there may be a reaction against the whole technique, and a potentially useful tool may be taken away.—ALICE M. RIVLIN, *chairman, Panel on Social Experimentation, The Brookings Institution, Washington, D.C. 20036.*

This editorial is adapted from an article in *Evaluation* 1, No. 2 (1973).

Most of your Bio Med problems can be solved by an unknown.

Say goodbye to time sharing. Give the pocket calculator to your kids. Stop wasting your time doing math with a pencil.

If you've got statistical problems, we've got a solution. The Compucorp Micro Statistician. The professional's machine.

The Statistician is a hand-held, battery operable Micro Computer that thinks the way you think.

It does blood gas analyses. Works chemistry problems. Breezes through medical calculations. Cures pathological headaches. Separates medical facts from fiction.

The Micro Statistician is the first and only hand-held Micro Computer with built-in standard deviation (grouped or ungrouped), linear regression, z-score, t-dependent and independent, logs and anti-logs, coefficient or correlation, expected y from regression coefficients, slope and intercept.

The Micro Statistician is also the first hand-held statistical machine that's programmable. It allows you to have two 80-step programs in memory at the same time. Which means

repetitive calculations are a snap. You can do register arithmetic in and out of all ten storage registers. And you can set the decimal point anywhere you want it. And change it whenever you want to.

The Compucorp Statistician is the first hand-held machine with 13-digit accuracy and a big, bright 10-digit display. It's also the first one with an algebraic keyboard and nested parentheses.

Get all the facts on Compucorp Micro Computers. We may be an unknown to you, but we're already solving tough Bio Med problems around the world.

See your local Compucorp dealer. Or write Computer Design Corporation, 12401 Olympic Boulevard, Los Angeles, California 90064.

ANNOUNCING: SCHOLARSHIP FOR SOCIETY

A Report on Emerging Roles and Responsibilities of Graduate Education in America

What's wrong with graduate education in America today?

Is graduate education meeting the needs of our society?

Can changes be made without sacrificing academic excellence?

Scholarship for Society, a report sponsored by the Council of Graduate Schools and the GRE Board, makes the following suggestions:

Publishing and research should not be the sole criteria for faculty promotion and tenure.

Discipline-related work outside the university should be a requirement for a Ph.D.

The report defines eight major problem areas in graduate education and makes 26 recommendations for change.

To order Scholarship for Society, send \$2 to Panel Report, Graduate Record Examinations Board, ETS, Princeton, New Jersey 08540

Computer users:

When's the last time your computer told you something really interesting?

Most computers just stand around spewing out a lot of numbers. Make yours tell you what you want to know in easy-to-read charts, graphs and plots.

With a TSP Plotting System you'll never have to wade through a pile of numbers again. Why TSP? Because we have

1. **Fastest systems on the market**—at least 3 times faster than anybody else.
2. **Lowest cost**—basic system is only \$3300.
3. **Most versatility**—both On Line (10-30 CPS) and Off Line Systems available.
4. **Most experience**—we were the first in the field.

Want proof? Just call or write for a free demonstration in your office, lab or plant and we'll show you how much you need a TSP Plotting System.

Spend a little time with us—you'll spend a lot less time with your computer.

PRODUCTS and MATERIALS

Gel Electrophoresis System

The Pharmacia system (Fig. 1) is applicable to projects involving gradient gel slab, two-dimensional and gel rod electrophoresis as well as isoelectric focusing techniques. The system consists of a four-cell apparatus, a high voltage power supply, an electrophoretic gel destainer with its power supply, and polymerized polyacrylamide gradient gels. Pharmacia Fine Chemicals, Incorporated. Circle No. 140 on Readers' Service Card.

Fig. 1. The Pharmacia gel electrophoresis system includes high-voltage power supplies for the electrophoresis cell apparatus and the gel destainer mounted conveniently.

Fig. 2. The Bio-Fiber Cell Culture Kit enables the operator to inject cells through the port into the culture tube where they adhere to semi-porous capillary fibers. They receive nutrient and oxygen through the fibers and grow in densities approximating those in vivo.

Human Cell Culture System

The Bio-Fiber Cell Culture Kit (Fig. 2) allows the growth of human cells in densities comparable to those found in vivo. The system features a small glass tube in which semi-porous fibers serve as artificial blood vessels. The second part is another small tube used as an oxygenator. Nutrient is pumped through the oxygenator, then through the capillary fibers in the cell culture tube. Nutrient and oxygen thus enter the culture area while waste products are removed. Cells are injected through jacket ports in the culture tube. The cells adhere to the fiber surfaces and new cells grow outward, approximating natural tissue growth. Bio-Rad Laboratories. Circle No. 138 on Readers' Service Card.

Blood Flowmeter

Cliniflow (Fig. 3) is designed for ease of operation in clinical applications. The operator dials a calibrated flow factor and adjusts the zero if necessary. Flow rate is displayed directly in milliliters per minute. Range and decimal settings are automatic. The reading unit may be

Fig. 3. Carolina Medical Electronics' Cliniflow blood flowmeter features easy operation, digital display, front-mounted controls, and isolation from the patient.

isolated from the patient even if external recording devices are connected. All controls and displays are front-mounted. There is also a model that will simultaneously measure flow and pressure when the input is from a catheter probe. Carolina Medical Electronics, Incorporated. Circle No. 136 on Readers' Service Card.

Scanning Electron Microscope

The Cam-Scan instrument features a horizontally mounted electron column which simplifies cleaning and maintenance. Magnification is variable from 10 to 9000 power with resolution better than 750 angstrom units. The rotating specimen chamber and air lock system allow changing of specimens in 40 seconds. The high vacuum does not deteriorate during specimen change, which prolongs the life of the scintillator and filament and minimizes contamination. Positioning of the specimen is by joystick and tilting and rotation are possible in any direction. A standard half-inch stub accommodates specimens up to 12 millimeters in diameter. The Random Interest Area Selector permits observation at higher magnification of selected areas illuminated with a target patch. Bausch & Lomb, Optical Products Division. Circle No. 139 on Readers' Service Card.

Printing Counter

Data-Print features a 16-channel rotary drum printing mechanism. Serial pulse inputs up to 1 megahertz are accommodated. Each of the 16 channels is represented by a counting decade with buffered input and "10 carry" output, thus all channel groupings are possible. Printing is accomplished by a 16-channel comparator/buffer storage and drum position coincidence. Because this operation is independent of the counting decades, counting may be continued during printing. The printer features automatic and/or external reset for each digit, programmable red and

Newly offered instrumentation, apparatus, and laboratory materials of interest to researchers in all disciplines in academic, industrial, and government organizations are featured in this space. Emphasis is given to purpose, chief characteristics, and availability of products and materials. Endorsement by *Science* or AAAS is not implied. Additional information may be obtained from the manufacturers or suppliers named by circling the appropriate number on the Readers' Service Card (see pages 18A and 114C) and placing it in the mailbox. Postage is free.—RICHARD G. SOMMER

black printing, and programmable "no print" blanking for each digit. The printing cycle is 400 milliseconds. The unit is complete with power supply and demand motor operation controlled by a built-in time-tachometer circuit. Coulbourn Instruments, Incorporated. Circle No. 137 on Readers' Service Card.

Mass Spectrometer Leak Detectors

The NRC 925 series features a stainless steel spectrometer tube with a disposable dual-filament ion source, plug-in electronic connections, and a cold cathode gauge. The leak-rate indicator reads directly from 2×10^{-11} to 6×10^{-5} standard cubic centimeters per second. The series comprises the 925 Manumatic detector, the 925 VFT detector, the 925-20 sensing tube, and the Integra-Test leak detector. The operator may choose a system to meet his specifications. Applications range from production testing of sealed relays and insulators to maintenance of particle accelerators and altitude chambers. Varian Associates, NRC Operation. Circle No. 135 on Reader's Service Card.

Literature

YSI Temperature Instruments is a four-page catalog of thermometers, thermographs, telemetry and temperature sensing devices for all laboratory and field applications. Yellow Springs Instrument Company. Circle No. 145 on Readers' Service Card.

Electronic Top-Loading Balances describes a line of laboratory devices. The electronic data may be read, recorded, or transmitted for computer analysis. Performance, design specifications, photographs, and schematic drawings are included. Mettler Instrument Corporation. Circle No. 146 on Readers' Service Card.

Chromatography Apparatus Catalog 80A275 is a 28-page brochure that illustrates the Lab-Crest line of columns, end-fittings, and accessories. Fischer & Porter Company. Circle No. 147 on Readers' Service Card.

Microscope Photometer, MPV System describes apparatus for microphotometry including the MPV2 microscope photometer. Applications, accessories, and performance data are illustrated. E. Leitz, Incorporated. Circle No. 148 on Readers' Service Card.

STRATEGIES OF BIOCHEMICAL ADAPTATION, by PETER HOCHACHKA and GEORGE N. SOMERO

Demonstrates the biochemical traits that enable an organism to survive and flourish in its environment: alteration of the concentration of macromolecular constituents in the cell, alteration of types of macromolecules, and modulation in macromolecular activity. Flow charts and diagrams depict environmental effects on physiologic processes. Published by W. B. Saunders Co. 1973, 358 pp., \$7.50.

ENERGY AND THE FUTURE

A new and authoritative AAAS book takes a long range look at energy. The broad scope and balanced perspective make it a valuable resource for anyone wishing to explore the scientific and technological bases of the energy dilemma. Presently in use as a text in more than thirty universities and colleges.

"At last book on energy that gives a comprehensive overview of emerging energy technologies. It reads like a What's What in Energy Research."

INTRACELLULAR STAINING IN NEUROBIOLOGY

An international group of researchers brings together

- all aspects of current experience with modern intracellular staining techniques
- applications of these methods to a wider variety of problems

Specific chapters deal with

- Procion dye as a marker for ultrastructural investigations
- use of cobalt as a staining compound
- implementation of computer techniques
- discussion of the applications to the study of the nervous system in major invertebrate and vertebrate groups

VERSATILE POWER SUPPLY

5 operating modes • stabilized power output

New, advanced DC power supply with silicon-controlled rectifier circuit makes automatic compensation for fluctuations in load resistance which protects samples and media from overheating. Size 16" x 9" x 7".

Operates completely unattended for unlimited periods of time.

5 operating modes: constant-current; constant-voltage; constant-current with upper voltage limit; constant-voltage with upper current limit; and limited voltage and current. Adjustable output 0-500 volts and 0-150mA.

Two pair of output sockets are provided, each fitted with a polarity reversal switch.

A large selection of other power supplies ranging up to 10,000 volts is available from Shandon Southern Instruments, Inc., 515 Broad Street, Sewickley, Pennsylvania 15143 (Pittsburgh District).

The Polytron[®] homogenizer.

BACK IN STOCK!

If it can be done, we can probably do it.

The Willems Polytron[®] homogenizer is unlike

any mixer you've ever used. It works on a unique principle—kinetic plus ultrasonic energy. And it often succeeds where other instruments fail.

Homogenization by sound waves means that tissues are broken down quickly to sub-cellular level without destruction of enzyme activity. You'd be hard-pressed to do that with other kinds of mixers.

In the applications field, the Polytron has proved so effective in inducing physical and chemical change that it has already revolutionized many procedures. Whether it be for dispersing, homogenizing, emulsifying or disrupting, a Polytron is available in the size to meet your specific requirements.

Contact us if you have any questions. Both literature and a demonstration are available on request.
