The new Sorvall® vertical rotor can slash density gradient spin time by cutting particle path length.

The new Sorvall® vertical rotor holds the tube at a fixed angle of 0° while the gradient reorients from horizontal to vertical. The calculated speeds and angles are illustrated above. As the rotor decelerates, the contents return to horizontal without mixing the gradient.

The vertical rotor reduces spin time because a particle must travel only the width of the tube and not the length. It also improves resolution by increasing the surface area and decreasing the depth of the starting zone. In fact, the K factor calculated for the highest performance ultraspeed swinging bucket rotor is 45, while the K factor calculated for the

Sorvall® TV865 vertical rotor is only 10.

Even better results can be expected when the vertical rotor is spun in a Sorvall® OTD ultracentrifuge with oil turbine drive and an automatic rate controller, because the soft start and soft stop characteristics of the ARC and Reograd mode of deceleration prevent disturbance of the gradient during acceleration and deceleration.

The new Sorvall® vertical rotor is available in two models for ultraspeed work and one for superspeed separations. All three spin more sample than

comparable swinging bucket rotors because they hold more tubes. For more information, write to Du Pont Instruments, Room 24023, Wilmington, DE 19898.

Luxuriant bed of *Potamogeton Robbinsii* at a depth of 5 meters observed during the winter ice cover in Lake George, New York. Plants are approximately 0.3 meter in length. See page 841. [Richard Sheldon and Tim Seamans, Rensselaer Polytechnic Institute, Troy, New York]

The American Association for the Advancement of Science was founded in and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress. Postmaster: Send Form 3579 to SCIENCE, 1515 Massachusetts Avenue, NW, Washington, D.C. 20005.

A multipurpose ultrasonic activator for every laboratory

BRANSON SONIFIER[®]

cell disruptor

- **DISRUPT** cells, bacteria, viruses, spores and tissue.
- **EXTRACT** compounds from animal and botanical tissues.
- **EMULSIFY** immiscible liquids.
- **POLYMERIZE** some materials and depolymerize others.
- **DISAGGREGATE** shale and fine grained sedimentary rock.
- **SEPARATE** micro fossils such as pollen.

The Branson SONIFIER[®] product line consists of three versatile cell disruptors for ultrasonic disintegration and homogenization: Model 350, 200 and 185. Each unit can be adjusted for either high or low intensity ultrasonic energy, and includes the following features:

- **ADJUSTABLE POWER OUTPUT** – Controls the intensity of ultrasonic vibrations transmitted into a solution, permitting the disruption of one compound, while leaving others, slightly more resistant, intact.
- **TIMER and OUTPUT METER** – Permit processing time and loading conditions to be recorded and repeated.
- **PULSER MODE** – Enables a solution to be processed on a pulsed basis to maintain constant temperature levels (available with the Model 350 and 200 only).
- **SOLID STATE CIRCUITRY** – For instant power with no warm-up time.

- **FANLESS CONVERTER** – Eliminates vibrations and air turbulence around the material being processed reducing the possibility of cross contamination.
- **ONE YEAR WARRANTY** – available with each unit and a five year warranty on SONOMAX[®] Circuitry.

A complete line of accessories includes micro tips, cooling cells, tissue disintegrators, sealed chambers, continuous flow horns and sound enclosures.

The BRANSON SONIFIER[®] Product Line is available from Branson Sonic Power Company through Branson Sales Representatives worldwide. For further information, including a complete list of applications, contact your nearest SONIFIER sales representative or: Fred Vitale, Branson Sonic Power Company, Eagle Road, Danbury, Ct 06810 Ph: (203) 744-0760. SERVICE
THAT PUTS YOU
MILES AHEAD.

WE MAKE THESE ELECTROSTATIC PRINTER/PLOTTERS EASIER TO READ.

Test it yourself with a free sample roll.

Graphic Controls electrostatic paper reads easier than conventional types.

Because it's obviously whiter...giving a sharper, blacker look to letters, numbers, dots and lines.

We **should** be able to produce a better paper. Making specialty papers is our **ONLY** business. We produce both report and translucent grades that fit all **Gould, Varian and Versatec** electrostatic printer/plotters in both roll and fanfold form.

In the wider roll sizes we offer the unique feature of rolls

cross-perforated every 11 inches for easy fanfold stacking.

As a standard feature, we sequentially page number all of our fanfold packs for increased operating efficiency and ease of information retrieval. For your specialized applications, roll and fanfold paper is available with preprinted formats in your choice of color.

All this and...priced significantly below your present supplier.

For more information—or a free sample to make your own reading test—use the coupon. Or call Ray Newstead, Manager of Marketing. Phone: (716) 853-7500, Ext. 352.

See what you measure while you measure.

**The Microscope-Photometer 03
is the only system in its price class
that offers these advantages:**

1. You can observe the full field and the measuring spot simultaneously *during* measurement.
2. You are always sure you're measuring *exactly* the area you have selected.
3. You can direct 100% of the light intensity to either detector or observer for maximum sensitivity, or you can share it between the two.

The MPM 03 System has great versatility, too.

The versatility starts, of course, with either a Zeiss Universal or, if you want a built-in, completely automatic 35 mm camera system, a Zeiss Photomicroscope (shown here.)

And the versatility grows with:

Tube heads for visible light, in fact, down to 350nm, or for UV/IR with image converters.

Interchangeable measuring inserts for specific tasks.

Recorders, printers, TV, and many other accessories.

Computer-controlled scanning packages with wide selection of software for advanced data processing.

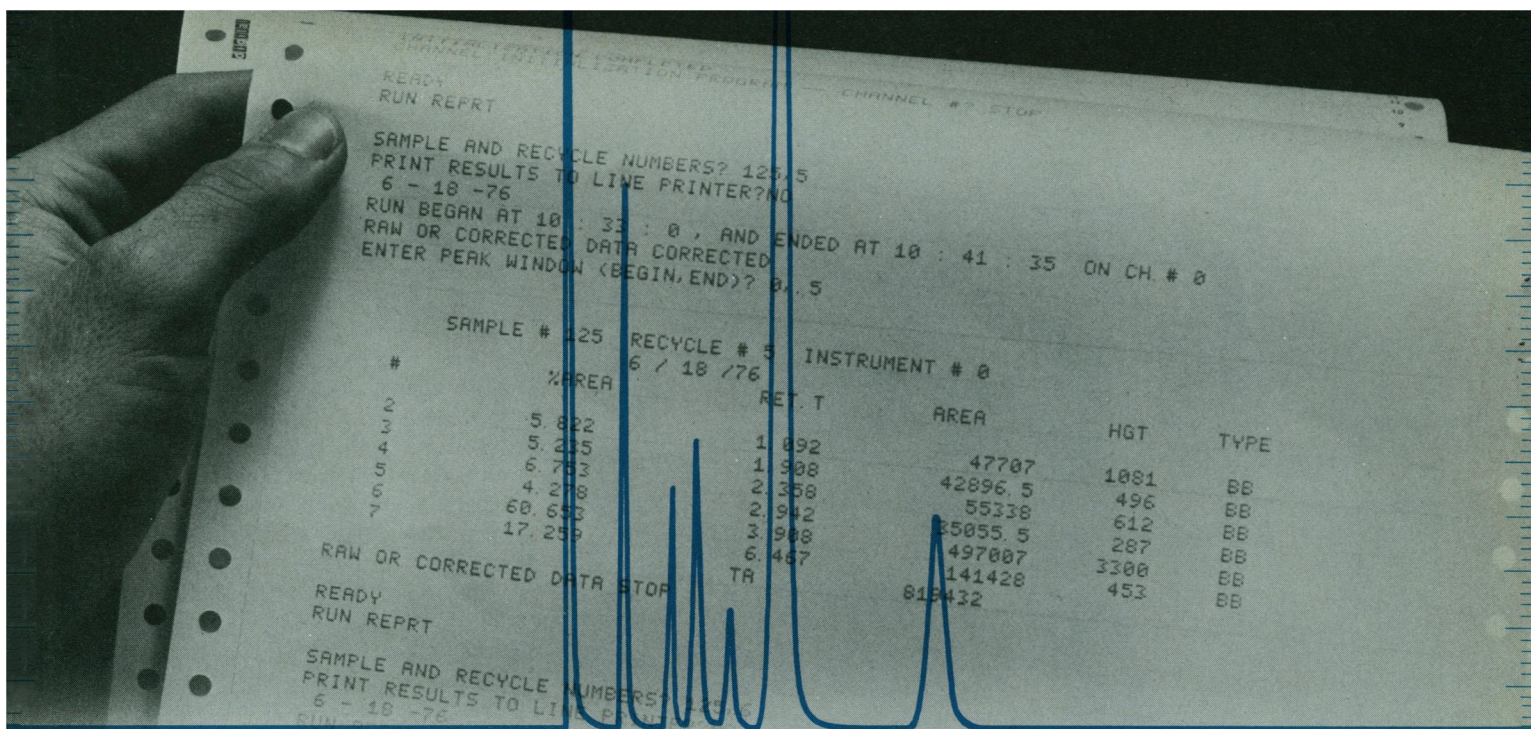

The 03 system is part of a full line of Zeiss Microscope Photometers, including the low-priced 01K and the ultra-sophisticated Axiomat Photometer System. Write today for literature or a demonstration.

Nationwide Service.

PEAK-11...designed to help you automate your laboratory without telling you how to run it.

Some laboratory systems only work one way. But if you need a system that handles a variety of tasks, the Digital PEAK-11 system is designed for you.

FLEXIBLE—PEAK-11 lets you process raw data, reprocess peak data, store it, update it, analyze and file it, all while the system is busy collecting data. In fact, PEAK-11, with its own foreground/background operating software, lets you automatically collect, process and simultaneously analyze data from up to 16 different peak-producing devices, such as GC, LC, AA, IR and UV-VIS instruments.

INTERACTIVE—PEAK-11 also lets you control what you collect. You set up your parameters and Digital's lab system will do the rest. It handles tasks like perpendicular drop and tangential skim, automatically. With Digital's multi-terminal BASIC, you decide on the best way to analyze and present the data. This system provides *simultaneous*

timesharing for your other general computational needs.

ECONOMICAL—You can get peak performance without paying high prices. A complete PEAK-11 system with a proven PDP-11/34 processor, twin disk packs, and a terminal costs *less than \$2,800 a channel* (or you can lease/purchase the system for under \$70 a month per channel).

EXPANDABLE—PEAK-11 is designed to grow as your laboratory grows. You can start with a basic system and expand later up to 124K words of memory, 8 removable disks, more terminals, and even a floating-point processor.

Interested? If you really want your lab to run at peak efficiency, contact your nearest Digital sales office to find out more about PEAK-11. Or send the coupon to Digital Equipment Corporation, MR2-4/M38, Marlborough, Mass. 01752; telephone 617-481-9511, extension 6949 or 6942. European headquarters: 81 route de l'Aire, 1211 Geneva 26. Tel: 42 79 50. In Canada: Digital Equipment of Canada, Ltd.

From tissue to homogenate in 30 seconds!

For homogenization, dispersion, defibration and emulsification, nothing works quite like a Polytron. Utilizing the Willems "High Frequency Principle", the Polytron combines ultrasonic energy with mechanical shearing action to homogenize virtually any type of tissue . . . small organs, soft bones, muscle, cartilage, even an entire mouse.

Because of its unique shearing effect, the Polytron outperforms any blender, mixer or similar homogenizer, and requires only 30-60 seconds to do what other instruments do in 15 minutes or more. This rapid action is an important advantage when working with heat-sensitive biological materials.

The Polytron system offers a wide selection of models, generators and speeds to provide ideal conditions for homogenization as dictated by type of material, experimental conditions and desired end result. For an informative brochure, write: Polytron Division, Brinkmann Instruments, Cantiague Road, Westbury, N.Y. 11590. In Canada: 50 Galaxy Boulevard, Rexdale (Toronto), Ont.

LETTERS

Animal Welfare and Scientific Research

Nicholas Wade's article "Animal rights: NIH cat sex study brings grief to New York museum" (News and Comment, 8 Oct., p. 162) requires a response because of its profound significance for science, and also because it is necessary to correct several substantive statements. Wade states, for example, that when the National Institutes of Health (NIH) asked the American Museum of Natural History for a special review of its animal welfare procedures, "instead of getting an independent committee to write them a clean bill of health," the Museum "turned to a group which consisted only of people with ties to the Museum. . . ." Wade fails to say that, in constituting this committee, the Museum followed *exactly* the instructions of NIH. This procedure, which the Museum has followed regularly and for many years, was clearly approved in a special report prepared by the NIH Animal Welfare Officer, Roy Kinard. Further, in response to a request by the Museum administration, William A. Sadler, chief of the Population and Reproduction Grants Branch of the National Institute of Child Health and Human Development, appointed an ad hoc committee consisting of Sadler and two leading research veterinarians, one from Harvard University and the other from the Oak Ridge National Laboratory. A detailed report of this committee was inserted by New York Congressman Edward Koch into the *Congressional Record* of 24 August 1976 which gave unqualified approval to all of our research procedures.

Wade describes one of the leaders of the actions against our institution, Henry Spira, as ". . . not an all-the-way antivivisectionist." In Spira's writings, repeated references are made to "mutilations" and "butchering" by the "greedy vivisectionists" of "millions" of "defenseless animals." Spira mentions specifically rats, mice, hamsters, rabbits, guinea pigs, birds, monkeys, and innocent beings, that are "being driven insane, suffocated, poisoned, battered, radiated, crushed, blinded, scalded." In none of his articles does Spira acknowledge that any animal should ever be used for any experiment, no matter how crucial it may be judged to be for human welfare or survival. How much further is "all-the-way"?

Moreover, Wade devotes roughly one-third of the article to some of the rationale of the antivivisectionist movement, such as the simplistic, reductionist idea

The Power of Quantitative Immuno-electrophoresis

If you're interested in identifying and measuring antigenic proteins or antibodies, take advantage of the power of Quantitative Immuno-electrophoresis. The many variations of this technique can offer you improved resolution, easier interpretation, simplified quantitation and faster results than other analytical methods.

Crossed Immunoelectrophoresis
Normal human serum vs. rabbit
anti-human whole serum protein

Whether you are documenting a separation procedure, measuring the concentration of a single antigen or comparing complex mixtures of antigens or antisera, one of the variations of Quantitative Immuno-electrophoresis will be perfect for you. Whatever the application or technique—from Laurell Rockets to Crossed Immuno-electrophoresis (as in the illustration above)—Bio-Rad has the chemicals, antibodies and equipment for them all.

that "alternatives to live animals," for example, research with computers, test tubes, and tissue cultures, can be substituted for animal experiments, and to the quasi-moralistic claim that animals have "rights" equal to the sociopolitical rights of women and minorities. Wade does not indicate that many see such statements as being antiscience and, in fact, fails to present any of the opposing views.

In Wade's effort to judge the value of our research on sex behavior of cats, he brushes aside the repeatedly favorable decisions of several peer review committees ("it is difficult to second-guess their judgment") and chooses as his sole criterion of scientific worthiness the number of citations in *Science Citation Index*. Of the 21 publications to which Wade refers, the seven full reports, each representing 3 to 5 years of continuous experimental observation, have all been cited except for one which was published in Moscow. In addition, two doctoral dissertations by former students have been cited as such, and later as journal publications. The remaining 14 publications were abstracts of reports given at scientific meetings while the work was in progress, and even a goodly number of these have been cited. As Eugene Garfield, father of the *Science Citation Index*, has emphasized, the index can only serve as a valid criterion if its limitations are recognized and it is used properly.

We believe that the criteria for the morality and ethics of research must include its significance for human welfare, but the statements made by critics of the moral and ethical aspects of our work raise doubts about their values in this respect. How much suffering does one allow, how many human lives and how many pets does one sacrifice in the name of the "rights" of discarded and unwanted cats and dogs or laboratory-raised animals? On the order of 1 million unwanted cats and dogs are destroyed each year in animal pounds, their use denied to legitimate research institutions. Wade chooses not to discuss these fundamental aspects of the problem. Ironically, we find ourselves in agreement with the antivivisectionists on one point. They are distributing copies of Wade's article, which they view as supporting their cause.

The AAAS, as the most representative organization of scientists in the country, is obligated to respond to the antiscience, anti-intellectual, and inhuman position taken by our critics.

Heart disease, cancer linked to trace metals

The possibility that variations in dietary and environmental levels of selenium, copper, zinc, and perhaps other metals influence the rate of heart disease in various parts of the world has been raised in a series of studies.

The rapid nondestructive ability to analyze many trace elements simultaneously is what X-ray energy spectrometry is all about. Now, new developments by KEVEX provide medical researchers, the pharmaceutical industry and process control people with analytical capabilities that offer far more potential than traditional techniques such as AA.

In this instance, the Kevex X-ray energy spectrometer measured the zinc-to-copper ratio and selenium concentration in two microliters of human breast fluid. A recent study shows a positive correlation between coronary mortality in 47 U.S. cities and the ratio of zinc-to-copper in cow milk of those areas. The connection between low cancer rate and high selenium diet was also reported for both cancer of the colon and breast cancer. (C & E News May 3, 1976.) The new Kevex ULTRA-TRACE™ X-ray energy spectrometer can analyze a fraction of a billionth of a gram of selenium in human breast fluid—total analysis time per determination—5 minutes! Are you interested in multi-element trace analysis? For more information contact Kevex at:

keveX

KEVEX Corporation

Spectrum for copper, zinc and selenium obtained from two microliters of human breast fluid.

Circle No. 51 on Readers' Service Card

The demonstrations against the animal behavior research at the American Museum of Natural History are potentially damaging at several levels. First, there is the potential damage to the public reputations of Lester Aronson and Madeline Cooper. Those who are unfamiliar with their research may wonder whether it justified the cost in dollars and animal lives. However, Aronson and Cooper will continue to be regarded highly by their scientific colleagues. Few scientists have contributed more to making us aware of the complex interactions be-

tween behavioral experience and the neurological and hormonal control of behavior.

Their recent work on the amygdala demonstrates that some widely held opinions on the function of this important part of the brain are wrong, partly because these opinions derived from research less sophisticated than that characteristic of Aronson and Cooper. Next, there is the potential damage to the Museum's Department of Animal Behavior. Since the late 1930's, this department has had a major influence on the concep-

tualization of human and animal behavior. Several of this nation's leading behavioral scientists were trained there, and the department's academic progeny are now teaching and doing laboratory and field research around the world. Under the curatorships of Frank A. Beach, T. C. Schneirla, and Lester Aronson, the department became a center of the "epigenetic" view of development, a theory which emphasizes that each stage of an organism's development results from a dynamic interaction between the organism and its environment. This view served as antithesis to the more preformationistic thesis of classical European ethology. If there is a current synthesis, it emerged from the interaction between the epigeneticists and the classical ethologists.

The broadest potential impact of the antivivisectionists is to reduce or eliminate the use of animals, or at least domestic animals and primates, in basic and applied biomedical research. Since these animals are often the most appropriate physiological models, the outcome would be to terminate research that cannot be initiated with humans. To the extent that this broad goal is achieved, human health and human knowledge may pay a terrible price.

The public's right to challenge the ethics and economics of animal research is unquestioned. The present peer review system, as fallible as it may be, has been largely successful in curbing unethical excesses and in fitting research priorities to available funds. Until a better system is developed, the peer review process should prevail.

One final note. Ten years ago, *Science* rejected, without review, a report by Aronson and Cooper because the editor felt that the sex research on cats, as described in that report, would offend the sensibilities of some *Science* readers, including antivivisectionists. Ultimately, *Science* had the report reviewed and published a modified version (8 Apr. 1966, p. 226) with no adverse repercussions. Despite the superficial sexual enlightenment of the last decade, the current reaction to the sexual aspects of the research of Aronson and Cooper and many of their colleagues indicates that, for many persons, basic research on sexual behavior is still beyond the pale. As Wade suggests, sex research tends to gain notoriety easily, no matter how ethically it may be conceived and executed.

WORLD LEADER IN FREEZE DRYING

Which Büchi/Brinkmann Rotary Evaporator should you get?

We make the choice hard, to make the extraction easy.

Büchi/Brinkmann offers rotary evaporators in a variety of models to facilitate all types of extractions.

There is a rotary evaporator for volumes as small as 5 ml, and Pilot Plant Models for volumes as large as 50 l. In between, there are models with variable speed electronic motors, sparkless induction and explosion-proof motors, quick-action jacks, stainless-steel heating baths, and a wide selection of flasks, condensers and accessories.

If the rotary evaporator you need is not shown here, you'll find it in the new Büchi/Brinkmann brochure. For your copy, write: Büchi Division, Brinkmann Instruments, Cantiague Road, Westbury, N.Y. In Canada: 50 Galaxy Boulevard, Rexdale (Toronto), Ont.

B Büchi/Brinkmann Rotavapors

ROTAVAPOR EL

Specially designed distribution head with built-in duct permits applications not possible with other rotary evaporators. Also has electronically-controlled motor, quick-action jack and stainless-steel heating bath.

ROTAVAPOR R-10

Designed for large volume applications. Has 10 liter flasks, mechanical lift, electronic speed control (10 to 150 r.p.m.) and thermostatically-controlled heating bath. For batch or continuous-feed operations.

ROTAVAPOR RE

Has fully transistorized, electronically controlled high torque motor. Variable speed, 10 to 220 r.p.m. Continuous solvent feed. Equipped with safety deflector shield, quick-action jack and stainless-steel heating bath.

SMALL VOLUME ROTAVAPOR M

For evaporations, organic synthesis, and analysis of volumes 5 to 100 ml. Rotates at 150 r.p.m. All glassware is threaded. Comes with 4 evaporating and 3 receiving flasks plus extra vacuum seals. Less than 2 ft. wide.

ROTAVAPOR R-50EX

Explosion-proof Pilot Plant Model for large volume extractions. 50 liter capacity flasks, high throughput of solvent. Variable speed motor. For batch or continuous-feed operations.

Instruments for Liquid Chromatography From ISCO

Detectors

The dual beam UA-5 is a sensitive, stable, multi-wavelength detector for conventional and high performance LC. Features include: 13 wavelengths from 254 to 660 nm; choice of either an internal or an external recorder; high pressure micro flow cells; optional Peak Separator for cutting peaks with an associated fraction collector; capability of automatic scale expansion and recording two columns or two wavelengths simultaneously; eight full scale absorbance ranges from 0.01 to 2.0 Abs, plus %T; an external recorder allows expanding the full scale range to 0.005 Abs.

Columns

ISCO supplies steel and glass columns, injection ports and sampling valves, fittings and connectors, syringes and septa, and the whole line of Whatman HPLC loose media and prepacked columns.

Almost any scientist will find ISCOTABLES useful. It's a handy booklet of hard-to-find data and tables. Ask for a free copy.

Literature

ISCO offers a wide range of additional instrumentation for analytical and biological chemists. For a look at our entire line of realistically-priced instruments, send for our new 64-page catalog.

Circle No. 135 on Readers' Service Card

Pumps

Three ISCO precision metering pumps provide accurately calibrated flow for laboratory applications. Programmed Dialagrad® gradient pumps combine two components to form almost any gradient with excellent reproducibility run after run. Both the isocratic and gradient types are available in Teflon or 200 kg/cm² stainless steel versions.

Complete Chromatographs

ISCO Series 1440 high performance liquid chromatographs not only provide the sophisticated instrument parameters required for top performance but do so at relatively low cost. They include many features found only as options on other systems. ISCO versatility lets you add a variety of accessories to seven basic combinations.

Fraction Collectors

This miniature instrument is the ideal fraction collector for HPLC. The ISCO line also has several full-size models to choose from, one of which holds up to 380 tubes, accepts scintillation vials and can retrieve from two columns simultaneously.

On Working with the Soviets

Out of the Brezhnev-Nixon handshake cementing détente in Soviet-American relations in 1972 has come a brisk traffic of shuttle diplomacy in science and technology. A wide array of agreements for joint studies and exchanges of information are being carried out, each with counterpart Soviet and American working parties. As the original bilateral agreement comes up for renewal next year, how should the American scientific and technological community assess the value of the work accomplished to date, and the merits of Round Two?

One way to go at it is to total the runs, hits, and errors and announce which side is "ahead." This is how the politics of Soviet-American relations have been played since World War II, and it is questionable whether the world is safer or happier. If détente in scientific and technical affairs is to be treated as an arena for competition and scored by the rules of competition, then we have strayed from the announced motive of cooperation. Whatever may be said for competition in the spheres of defense and power politics, it is no standard for judging a *process* designed to find common ground between two powerful systems.

As one casts a critical eye over the universe of the cooperative projects in science and technology, it becomes clear that the majority have progressed quite well, while a few others are struggling. In some cases it has been hard to find a handle, in others there arose semantic and conceptual problems which took time and patience to iron out, and there were the difficulties which always arise when busy people on each side can give only fractional time to the work.

The basis for the agreements was equivalency. From the start, it was to be a fifty-fifty proposition, with each side getting comparable benefits. The U.S. side has not relaxed that rule, and the result is that the accounts appear to be balanced. But equivalency is in large measure a matter for judgment rather than precise scoring, and the bottom line can always be a subject for argument. Moreover, when two such different systems try to get together, they come to the table with different premises and constraints. These do not disappear with a handshake. Equivalency comes slowly, stage by stage. It is a point to be kept in mind by détente-watchers.

The exchange has been especially lively with respect to the comparisons of national science policies. While the Soviet practice is to build scientific research and development into their macroeconomic plans for periods of as much as 15 years, keying it to upwards of 200 priority problems in each 5-year planning segment, their R & D is not locked in so firmly that goals and strategies cannot be changed on short notice. The Soviet passion for planning provides more continuity and stability for science than we do, and their policy recognizes the investment nature of R & D in a way that ours never has. Where we seem to do better is in applying research results under conditions of market choice and risk, even without the help of an explicit emphasis on large doses of R & D in macroeconomic policy. With all the basic differences, both systems seem to produce very good research and innovation.

As the American and Soviet working groups have learned how to get along, the momentum has picked up. Experts are traveling in both directions, previously unavailable data are being gathered and evaluated, and case studies of comparative technologies, research and innovation, and problem-solving are being exchanged. Recent meetings in both countries have been unusually productive, suggesting rising confidence on both sides. It is not all a bed of roses, for there are some bare patches. But the prognosis is decidedly better than it was even a year ago. All things considered, the case for Round Two is a good one.—WILLIAM D. CAREY

The universal Teflon[®] dispenser.

It works as smoothly with alkalis as with acids.

Dispensette is the universal bottle-top dispenser that does lots of things better than conventional all-glass dispensers; dispensing alkaline solutions without sticking or 'freezing' is one of them.

On a Dispensette, the plunger is Teflon coated to insure smoother movement inside the precision-

ground borosilicate glass cylinder. The flexible filling tube and curved

discharge tip are also Teflon, eliminating external glass tubing that could break off, chip or crack. (And either tube can easily be cut to any desired length).

There's a wide choice of adjustable and fixed-volume Dispensettes for fast, accurate dispensing of exact

volumes from 0.1 to 50ml with better than $\pm 1.0\%$ accuracy and $\pm 0.1\%$ reproducibility. All can be autoclaved at 120°C without disassembling. All mount directly on 33mm screw-neck reagent bottles, and on most other size bottles, cans or containers (including STJ 24/40 and STJ 29/42 glassware) using optional screw-in adapters. Dispensettes work smoothly with all reactive chemicals (except HF), including concentrated alkalis.

For literature on the smoothest working, least fragile universal dispenser yet designed, just write: Brinkmann Instruments, Cantiague Road, Westbury, N.Y. 11590. In Canada: 50 Galaxy Boulevard, Rexdale, Ontario M9W 4Y5.

Gilson Dual-Beam UV Monitor for Liquid Chromatography

MODEL 260

STABLE MEASUREMENTS—0.0005 OD per
hour maximum drift
HIGH SENSITIVITY—0.05 OD full scale
SMALL CUVETTES—100 or 20 µl cell volume
WIDE RANGE—254 to 700 nm wavelengths
CONVENIENCE—different wavelength filters
are easily interchanged
INERT—Liquids make contact only with
Teflon, Tefzel and sapphire

Available are other models which can perform dual-wave length,
differential and two-channel measurements with greater sen-
sitivity and stability.

Cyclic AMP, GMP determination:

Second antibody sensitivity without second incubation

These new ¹²⁵I RIA kits from NEN combine extreme sensitivity with speed and convenience. We developed a very sensitive first antibody and pre-reacted it with a second antibody to eliminate the intermediate incubation.

Femtomole sensitivity is easily achieved by acetylation — with reagents provided in the kits.

There are other improvements, too. The iodinated tracer is exceptionally stable and is stored refrigerated, not frozen. Pipetting is done at room temperature. And a tritium-labeled marker is included to monitor sample recovery.

The resulting system is highly sensitive, accurate, reproducible, and yields low blanks.

Everything else is included for running 200 tubes — buffer, standards, complete protocol — even a telephone number if we can be of technical assistance. Ask us to send you our technical brochure.

LETTERS

(Continued from page 786)

Let me comment on the "historical trend . . . from minorities' rights, to women's rights, to animal rights" that, according to Wade, has given philosophical fuel to the controversy on animal experimentation. If the trend continues, it may well bring the controversy to an end. As recounted by Samuel Butler (*1*) this is precisely what happened a long time ago in the mythical country of Erewhon. A fussy old prophet, it seems, had stood up for the rights of animals with

such fervor that for 600 years the Erewhonians were by law allowed to eat animal food only if the animal had died of natural causes, including suicide. Then along came a philosophically inclined Professor of Botany who argued convincingly that vegetables are only animals under another name. The Professor maintained, in fact, ". . . that animals and plants are cousins, and would have been seen to be so, all along, if people had not made an arbitrary and unreasonable division between what they chose to call the animal and vegetable 'kingdoms.'" He therefore proposed that the natural death

rule should logically also apply to vegetables and their seeds. "Having thus driven his fellow-countrymen into a corner at the point of a logical bayonet," Butler continues, the Professor referred the confused Erewhonians to an Oracle, whose response sanctioned the eating of fresh vegetables and, by extension, of animals killed for the purpose. The Erewhonians then repealed the ill-tolerated and controversial vegetarian laws, and lived more or less happily ever after.

Thus, we'll just have to wait for the modern counterpart of the old philosopher who will stand up for the rights of vegetables. When vegetarians, botanists, farmers, and gardeners arouse the same outraged feelings as meat eaters, experimental psychologists, dogcatchers, and baby-seal clobberers are doing now, an Oracle may be found whose words will retrieve us, as Butler puts it, from wandering in the wilderness of philosophy.

Is it utterly foolish to wish that people could get as steamed up about operations on scientists at Leningrad state prison (Letters, 8 Oct., p. 133) as on cats at the American Museum of Natural History?

NELSON R. ELDRED

5701 Kentucky Avenue,
Pittsburgh, Pennsylvania 15232

The scientific establishment is not, as many feel, under attack from overemotional antivivisectionists. Other organizations with a more balanced approach, such as The Humane Society of the United States, have also voiced their concern. The embarrassing scenario involving the Department of Animal Behavior at the American Museum of Natural History is symptomatic of the effect of a widespread and relatively radical change in societal values and attitudes. These values and attitudes impinge upon biomedical research and especially upon so-called basic research, which is (to quote the director of the Museum) the "freedom to study whatever it [the Museum] chooses, without regard to its demonstrable practical value." The scientific community that uses animals and whose basic research is supported wholly or in part by the taxpayer should be open to discussion of the validity of their work.

Three questions need to be addressed: (i) Should the "luxury" of basic re-

SCIENCE, VOL. 194

Meet the smart incubator shaker

Set this bench-top incubator shaker at any speed from 40 to 500 rpm and it remembers—whether the line voltage fluctuates or you change the load. Once the temperature is set, it holds. Open the lid for as long as 120 seconds, and the sample temperature won't budge a fraction of a degree. We made it "smart" so that you never have to worry. And, we made it durable for the same reason. The drive is ball-bearing mounted and dynamically balanced to insure smooth, stable performance for years and years. You can even introduce gas mixtures.

search, of seeking knowledge for knowledge's sake (and with no foreseeable applied value) be supported by public funds? (ii) Is it fair, ethically speaking, to use animals in studies—to create and destroy life and sometimes cause suffering (if unavoidably “essential” for the research) for purely intellectual reasons? (iii) If relevance of such animal studies to an understanding of human diseases or other “humanocentric” problems is claimed, does not the basic researcher create his own trap? Relevance, after years of reductionism and nonapplied research on esoteric subjects, may be very difficult to demonstrate.

The complex area of basic biomedical research—including many studies in animal behavior and physiological psychology—needs to be looked at from a new perspective. Beginning with animal rights is only a start. We will get nowhere if the basic researcher remains locked in his own conceptual world of consensus values, approved standards of animal care, and so forth. We must all be free to look “objectively” at ourselves and avoid being defensive under the fire of outside criticism by others who do not share the same world view. Basic research, and biomedical research in general, may well benefit once open and constructive dialog on animal research is achieved—with ultimate benefit, one would hope, to the animals themselves.

MICHAEL W. FOX

Institute for the Study of Animal Problems, 2100 L Street, NW, Washington, D.C. 20037

I regret that Aronson finds hostile an article in which his assailants' two most serious charges are dismissed as groundless or absurd and the third is discussed but not endorsed. It is only in general terms, not in their specific attack on the Museum, that I think the animal rights groups' arguments are at least worth considering. Their campaign has undoubtedly been hard on Aronson and on the Museum. Aronson, as the article concludes in discussing the campaign, “is an established and productive scientist whose work, in the aspects for which it is being assailed, differs in no way from the research carried on by a great many other investigators.”—N.W.

Erratum: In the letter from William R. Havender (1 Oct., page 9, column 2, paragraph 1, the next-to-last-sentence), the word “not” was inadvertently omitted from the parenthetical phrase, “. . . (or else, the within-group heritabilities would not be high, as posited).”

Erratum: In the reply to the letter from Vladimir J. Konečni by Harry W. Power (5 Nov., page 563, column 2, paragraph 1), the last sentence should have read “To treat a functional dichotomy as a continuum is to do as great a violence to truth as to treat a continuum as a dichotomy.”

RESEARCH NEWS

(Continued from page 826)

force as deuterium is to the nuclear force. The interaction appears to be quite complicated. There is a need for large spin-orbit and tensor forces which are as as yet incompletely understood. The central force is not an inverse-square or harmonic-oscillator one, but something intermediate; roughly a force independent of the quark-antiquark separation. But in any case great optimism remains that in the long run the charmonium system can teach much about whether, why, and how quarks of fractional charge are confined within hadrons.

Thus, rather rapidly, the evidence for ψ being a member of the hadron family as well as a bound state of a spin 1/2 constituent with its antiparticle became quite decisive. Just this much explains its production by gamma-rays, the charmonium levels and helps to interpret the large yield of hadrons at high energy observed by CEA and SPEAR. The crucial test came in the expectation that charmed quarks will bind to uncharmed antiquarks, forming overtly charmed hadrons. Their rest energy could be estimated at about 2 Gev, and in analogy to the behavior of strange particles they would be unstable with respect to the weak interactions. This leads to an estimated lifetime of order 10^{-13} second for a 2-GeV charmed particle. No time was wasted in embarking on the search. Ting was in an especially good position to attempt the search himself, using his spectrometers to detect charmed particles which decayed into two oppositely charged hadrons. Ultimately 10 million events were accumulated, but no positive evidence was found. A similar experiment at Fermilab extended his result to higher energies, and as yet charmed hadrons have not been detected as products of hadron-hadron collisions.

Actually, it was expected that electron-positron annihilation and neutrino reactions would be the best sources of charmed particles, but for a long time the search was inconclusive. Neutrino-induced reactions did provide positive evidence for charm, but not until the discovery of charmed mesons at SPEAR this year did the case for charm become highly persuasive. There is perhaps still room for the skeptic to doubt the existence of charm (not to mention the quark) but it is a severe uphill battle to do so.

The charm concept is more than just a label for a fourth quark; it has specific implications for problems of the weak interactions. The word charm was intro-

Pharmacia Peristaltic Pump P-3

A compact pump electronically controlled for constant liquid flows in chromatography and gradient formation

You can

- obtain three different flow rates at the same time through the three individually tensioned pumping channels
- change tubes in seconds with the snap-in cassette
- forget about pulsation thanks to the large driven rollers
- rely on a constant motor speed, electronically compensated for load and temperature
- use any flow rate between 0.6 and 400 ml/h per channel with the same gear box
- reverse the flow instantly
- push for maximum flow and clear pump lines rapidly

super duper

That's what owners call the Illumitran 3 because it's the quick, simple and economical way to duplicate your color slides.

But there's much more to the story.

The special value of the Illumitran is in how it helps improve your original transparencies; how it makes it easy to color correct, enhance or crop and enlarge the almost perfect slide.

Exposure is controlled simply by a direct reading meter coupled to the flash stage. You get correct setting whether compensating for originals of varying density or for color correcting filters. You can copy originals up to 4 x 5; make or copy filmstrips; crop; make blowups and reductions; internegatives and Polaroid® prints. In fact, we can't tell you all its uses. Illumitran owners constantly tell us of new applications.

A built-in automatically controlled electronic flash gives you a 5:1; repeatable continuously variable output in each of two intensity ranges: one for conventional daylight color films, the second, for the new color duping emulsions. Color temperature is a constant 5600°K.

Ask your dealer or write for a brochure and learn why experts consider the Illumitran THE transparency duplicator.

duced by Sheldon Glashow (4) as early as 1964. Given the introduction of a fourth degree of freedom for hadrons, a formulation of weak interactions was found that was more symmetrically balanced between hadrons and leptons (the family containing electrons, muons, and their neutrinos). The unique feature of this charm picture was the prediction that charmed matter should decay weakly and predominantly into states containing strange matter. This signature made the search for charm quite specific, and the prediction so far appears to be borne out by experiment—although much remains unclear. But in 1964 this was mostly speculation and esthetics.

In 1970 real operational use was found for the charm concept in dealing with problems of the high-energy behavior of the weak interactions. The basic description Fermi so brilliantly provided in 1932 (as refined by a few others in the subsequent 30 years) necessarily fails at high energies, of order 1000 GeV of center-of-mass energy. Corrections must exist. During the late 1960's, confidence in the technique of estimating such corrections grew (thanks to large extent to the work of the Soviet theorist B. L. Ioffe) and it was found that unless some new physics intervened at an energy scale of only a few GeV, it was difficult to understand why the two neutral strange mesons, K_L and K_S , should possess such a small mass difference (experimentally it is less than one part in 10^{11} of the electron mass). In 1970 Glashow, with J. Iliopoulos and L. Maiani, showed that the 1964 charm scheme did the job, provided the charmed quark was not too heavy.

This observation lay dormant for a couple of years, until some beautiful mathematical physics by a young Dutch physicist Gerard 'tHooft opened the way for a quantitative theory of weak interactions, where such corrections can be systematically computed. Not only is such a theory practical from the point of view of computation, but its starting point is modeled after quantum electrodynamics. Even more, quantum electrodynamics is subsumed into the larger structure, somewhat as electrostatics and magnetism are subsumed within Maxwell's electrodynamics. Finally, the simplest version of such a unified weak electromagnetic theory, as formulated by Steven Weinberg and Abdus Salam, requires the existence of muonless neutrino-nucleon interactions ("neutral currents"). These not only have been found but, most importantly, agree quantitatively with the theory. It is no wonder that this theory is by far the most serious candidate for a successful description of the weak force in its natural

energy domain. But, for essentially the reasons discovered earlier, inclusion of the charmed quark appears to be an unavoidable ingredient in this theory as well.

Thus the existence of charm lends support of sorts to the present viewpoint on weak interactions and its potential synthesis with electrodynamics. Nowadays, with charm scarcely established, many are already looking far beyond the detailed study of charmed matter. Ting has followed Lederman to the CERN storage rings and is now mounting a large experiment, this time to detect muon pairs with rest energies up to 15 GeV, in the hope that history may repeat again: there is no particular reason why the number of quark types should stop at four. Richter is deeply involved in a large electron-positron storage ring project (PEP) which is under way at SLAC. Center-of-mass energies of more than 30 GeV will be available upon completion of the project in about 1980. Ting is also planning an experiment at a similar project (PETRA) under construction at DESY. Beyond that, Richter is a strong proponent of the eventual construction of very large electron-positron rings of center-of-mass energy up to 200 GeV. If the present viewpoint of weak interactions is correct, at these energies quantum electrodynamics, as Richter and Ting knew it in the 1960's, *should* break down, and with their 30-GeV experiments at PEP and PETRA they should be able to see the breakdown occur. If they do not, and instead the old quantum electrodynamics is verified, there will be almost as much impact on the theory as had Ting or Richter found a breakdown in their early experiments.

3. There is no general consensus on the ultimate name of J/ψ . With all due respect to Professor Ting, I choose to use the name ψ here. Not only is it a matter of habit, but also the ψ (3.1) appears to be a member of a family containing ψ (3.7), ψ (4.1), . . . , whose names are not ambiguous. Given that J is married to these others, is it not appropriate to change its maiden name?
4. B. J. Björken and S. L. Glashow, *Phys. Lett.* **11**, 255 (1964). The peculiar spelling of my name was used in order to maintain deniability, which I here affirm. In that paper our relative contributions to the development of the charm concept were in the same proportion as our subsequent contributions.

Calumet is

Supercold Freezers

- Complete line of supercold freezers including upright, bench top and low profile chest models.
- Frost resistant sealed and insulated inner doors on upright models.
- Chest models are countertop height for ease of access.
- Temperatures to -100°C ; capacities to 23 cubic feet.

Write today for our descriptive literature on freezers, incubators, growth chambers, and environmental rooms.

Calumet is professional photographic equipment. Calumet Scientific also offers you the highest quality professional photographic equipment at direct-from-the-factory savings.

architect.

Dear Architect:

Our primary business is supplying virtually everything needed to house and care for laboratory animals. Inevitably, this has given us insight into the needs of such facilities and has also put us in touch with the basic sources of information useful to people like yourself. Accordingly, we can help with planning or with guidance as to who has the information you need. And we're happy to share all this with you... without any obligation whatsoever. Write or call Neil Campbell, Lab Products, Inc., 365 W. Passaic St., Rochelle Park, N.J. 07662 (phone: 201/843-4600).

The finest fermenter in the world arrives.

B. Braun's BIostat® laboratory fermenters have proven themselves extensively in the most prestigious laboratories of Europe. Now they're available for the first time in the United States and give you a first-class alternative to other systems.

The essential virtues of BIostat fermenters center around their unexcelled monitoring and regulating features, along with exceptional versatility.

Rugged, continuous-duty systems, BIostat fermenters fulfill all requirements for the submersed, continuous growth of microorganisms on the chemostat and batch principle. Reproducibility is assured through precisely-controlled parameters: temperature, stirring speed, nutrient feeding, anti-foaming, acidity, alkalinity, oxygenation, gas flow, and humidity control.

Sterility? Our multiple sealing systems protect against contamination. The modular nature of the system allows us to tailor an instrument to your precise requirements. Let us convince you. Contact:
