The Ploemopak 2 readily adapts Leitz "building block" microscopes for fluorescence microscopy.

Leitz introduces the second generation vertical fluorescence illuminator.

filter modules. About the size of a Flashcube, each module is an entire filter system: exciter filter, dichroic beam splitter and suppression filter.

This completely new Ploem unit is designed to ease your work by making fluorescence techniques as convenient as possible; to permit use of all the methods of fluorescence microscopy; and to be adaptable to any new development.

These requisites are met with interchangeable

Four modules can be placed in the illuminator body. They mount on a turret so you can quickly switch from one to another.

Sixteen modules are available. Twelve have filter systems that meet the characteristics of specific fluorochromes. Four other modules have built-in beam splitters; you choose your own filters.

New optics complement the system. These 10 X to 100 X oil immersion objectives provide highest intensity and contrast.

Ploemopak models are available for all current Leitz microscopes. For information call 201-767-1100 or write E. Leitz, Inc., Rockleigh, N.J. 07647. Dept. SX1

The American Association for the Advancement of Science was founded in and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress. Postmaster: Send Form 3579 to SCIENCE, 1515 Massachusetts Avenue, NW, Washington, D.C. 20005.

Finding good
science books
and films
can be very
hard . . .

. . . Or
very easy.

It's really up to you. If you have plenty of time, shelf space, and money you may not need **SCIENCE BOOKS & FILMS**. But if you're looking for a quick, *reliable* way to find good science information sources, let **SB&F** be your guide. Each issue reviews hundreds of the latest trade books, textbooks, reference works, and 16mm films in the pure and applied sciences. Using this single selection tool, you can find good science materials for readers and viewers at all levels—from kindergarten through college. And you can have confidence in the reliability of the reviews and the rating system. Our reviewers are specialists with scientific expertise as well as practical teaching experience. Their signed reviews are authoritative, informative, and interesting. A simple coding system shows at a glance how the reviewer rates each book or film and for what level it is suitable. So the next time you're looking for science materials—on euthanasia . . . or land use and misuse . . . or manned spacecraft . . . or atomic physics . . . or hang gliding . . . or endangered wildlife . . . or ants . . . or whatever—remember **SB&F**. We take the trouble to save you time and money.

Subscriptions are \$16.00 per year (\$15.00 for AAAS members)
or \$28.00 for two years.

SB&F
the quarterly review

Faster than a speeding bullet. More powerful than an Eclipse S/200.

It's more memory. It's more software.
It's more speed. It's SuperEclipse!

Disguised as a mild mannered small computer, our new Eclipse S/230 leaps to the top of the scientific Eclipse line. More powerful because it has double the memory of the S/200, with 512K Bytes. As well as our new heuristic Advanced Operating System, for maximum resource utility and intelligent multiprogramming.

And if you think the S/200 was fast, our new time fighter has a 500 nanosecond MOS memory cycle time, and "look ahead" mapping for faster memory access.

Our SuperEclipse can meet the toughest challenges with the most advanced instruction

sets in the industry. Regular 16-bit single word or 32-bit double word instructions. And super fast floating point.

But the Eclipse S/230 is more than powerful; its high density core or MOS memory modules make it super reliable, too. With a full range of options and peripherals. And lots of support. For a lot less than you might think.

The Eclipse S/230. Here when you need it. With powers far beyond those of ordinary small computers. To discover its true identity, send for our brochure.

S/230 IT'S A SUPERECLIPSE

AAAS–Newcomb Cleveland Prize

To be eligible, a paper must be a first-time presentation (other than to a departmental seminar or colloquium) of previously unpublished results of the author's own research. Reference to pertinent earlier work by the author may be included to give perspective.

appearing in the Reports section. Nominations must be typed, and the following information provided: the title of the paper, issue in which it was published, author's name, and a brief statement of justification for nomination. Nominations should be submitted to AAAS-Newcomb Cleveland Prize, AAAS, 1515 Massachusetts Avenue, NW, Washington, D.C. 20005. Final selection will rest with a panel of distinguished scientists appointed by the Board of Directors.

The award will be presented at a session of the annual meeting at which the winner will be invited to present a scientific paper reviewing the field related to the prize-winning research. The review paper will subsequently be published in *Science*. In cases of multiple authorship, the prize will be divided equally between or among the authors; the senior author will be invited to speak at the annual meeting.

Soviet Civil Defense

Deborah Shapley's article "Soviet civil defense: Insiders argue whether strategic balance is shaken" (News and Comment, 10 Dec. 1976, p. 1141) provides information that should prove useful to scientists and others concerned with the strategic significance of realistic civil defense preparations.

Her description of the Soviet civil defense installations is quite comprehensive. The only relevant point that we found lacking is the instruction of the people in civil defense measures. Every schoolchild has 3 years' instruction in the effects of nuclear weapons and in the civil defense measures to minimize them. A total of about 135 hours is devoted to the subject. There is similar instruction in factories, and hundreds of thousands of handbooks on civil defense are published and distributed.

Another factor, mentioned by Shapley but in our view underemphasized, is the plan for evacuation. If this is carried out and followed by a set of demands resulting in a confrontation, the bargaining position of our country would be miserable. The Soviet Union could threaten to destroy half of the U.S. population; we could destroy only a small fraction of theirs. The Soviet losses would be well below those suffered in World War II. Such a threat, "nuclear blackmail," is the danger many of us fear most. The first of the above numbers is confirmed in the published part of the *Ponast II* study (1). Soviet losses are estimated to be between 2¾ and 4½ percent in their civil defense handbooks, but some of the U.S. estimates, though still quite low, are considerably higher. The estimate of one of us (E.P.W.) agrees with the Soviet estimate.

To discover the "motives behind Soviet population defense" one should read what Soviet leaders have clearly and repeatedly told their own people. One key to the understanding of these motives is Lenin's often quoted dictum: "The primary productive factor of all of humanity is the laboring man, the worker. If he survives, we can save everything and restore everything—but we shall perish if we are not able to save him" (2). Of course, if they can push us by threats into repeated concessions, just as Hitler pushed Czechoslovakia, there would be no need to rebuild their factories. The Soviets, like the majority of mankind, always have believed that a primary responsibility of any nation's government is making preparations to save the lives of its citizens if war oc-

curs. Soviet military and civilian leaders have always rejected the concepts of "mutual assured destruction," a strategic theory based on the United States and the Soviet Union leaving their populations vulnerable. One of the Soviet responses to U.S. threats, first of "massive retaliation" and then of "assured destruction," is their comprehensive preparations to survive even an all-out war.

Let us observe, finally, that we cannot quite understand Panofsky's and Garwin's fear, quoted in the article, that a U.S. civil defense effort would alarm the Soviet leaders and would be destabilizing. If the Soviet civil defense does not alarm them and is not destabilizing, why would our emulation of some of these measures be alarming and destabilizing? Did Khrushchev not say, "Don't be afraid. If I offer my embrace, you will not refuse it"?

TVA's Record

I should like to compliment Deborah Shapley on her article (News and Comment, 19 Nov. 1976, p. 814) concerning the Tennessee Valley Authority (TVA). The case against TVA is convincingly delineated from the early days when it "arrived" to tame the rampaging rivers, advise the farmers on better agricultural methods, and, yes, as a by-product, to produce the electrical energy hitherto absent in the Tennessee Valley.

Over the course of its development, TVA has performed a comprehensive service to the citizens of this poverty-shackled valley that private utility companies were reluctant to offer. Utility planners worth their keep could not survive for long by suggesting that large capital expenditures be directed toward a rural, backward region where the median income was less than half that of the rest of the country. However, Congress accepted the socioeconomic challenge and created TVA. Yet because it is the largest utility in the nation, TVA de-

Brinkmann pHisolytes. New carrier ampholytes for isoelectric focusing.

pH 2	—	10
pH 2	— 4	
pH 3	— 5	
pH 4	— 6	
pH 5	— 7	
pH 6	— 8	
pH 7	— 9	
pH 8	— 10	
pH 9	— 11	

Because they contain more amphoteres than other ampholytes, Brinkmann pHisolytes provide a wider general pH range, from pH 2 to 10. pHisolytes are also available in eight individual pH ranges, each with a span of 2 pH units, from pH 2-4 to pH 9-11.

pHisolytes are composed of amphoteres synthesized from aliphatic polyamines with primary, secondary and tertiary amines and guanidine groups. They range in molecular weight from 400 to 700 and are easily separated from proteins by gel filtration techniques. pHisolytes come in sterile vials of 25 ml; each batch is tested for buffering capacity and adsorption.

serves more than a thumbnail analysis. Bigness, in and of itself, does not connote wrongness, nor does it imply that decision-making is divorced from humanistic considerations. Perhaps these people, who must gaze into the crystal ball of future energy needs, may see a demand mirage which will vanish as time progresses. Then, again, one may also assume that their projective techniques are reasonably accurate. After all, our natural gas deliveries have been curtailed by almost 50 percent since 1973, while the price of other hydrocarbon fuels has more than doubled. Availability and price coupled with national security implications have already begun to exert their combined influence on our traditional energy mix. We must become increasingly dependent on the electrical energy provided by utilities like TVA.

The decision to use the controlled fission of slightly enriched uranium to produce this additional electrical energy was not something that TVA's engineers, economists, and planners came up with overnight. Such decisions required long, arduous studies by many talented experts. From the time a decision is reached to add nuclear generating capacity, or for that matter any capacity, it takes another 5 to 10 years to design, construct, and license this capacity. Large, 1000-megawatt generating units now require capital investments in excess of a quarter of a billion dollars. In short, electric utilities cannot create additional capacity without gargantuan front-end investments of manpower, time, and capital.

TVA rates have, like the price of coal, escalated rapidly since the 1973 energy crisis. Poor people, as well as those more economically blessed, have felt the pinch of higher monthly electric bills. However, there are few rich or poor consumers in the Valley who would trade their electric bills for those arriving at the homes of residents in the northeastern part of the country.

It is true that the massive fire born from the small candle at TVA's Brown's Ferry Nuclear plant should never have happened. Although the damage and resulting inactivity of the plant was very costly, the fire did illustrate that the multiplicity of safeguards built into the plant did indeed work. Nuclear power, as the proponents had preached, was safe.

Finally, it has become increasingly popular to heckle TVA and to attack it as being nonresponsive, self-serving, and divorced from the real needs of the Valley residents. Critics have forced TVA to open its board meetings to public scrutiny. This move has not damaged the effec-

tiveness of TVA, nor made it vanish; in fact, the move may prove to be highly beneficial over the long run.

TVA will continue to make mistakes, like all institutions which are managed by man. However, they will be honest mistakes from which all of us can learn. It is in this atmosphere of trust and mutual respect that the TVA experiment will go forward toward improving the stations of those of us fortunate enough to call the Valley our home.

Human Rights

The recently appointed AAAS Committee on Scientific Freedom and Responsibility (1) has asked us to constitute its Subcommittee on Infringements of Scientific Freedom in Foreign Countries. We are, of course, well aware of widespread violations of human rights, which affect people of all classes and occupations in many parts of the world. We believe, however, that we can be more helpful by focusing attention on rights of our fellow scientists, rather than diffusing our concern more widely. This subcommittee therefore will collect data on, and endeavor to find ways to ameliorate, violations of the human rights of scientists, particularly those rights which are of special importance to their scientific work. Briefly, these rights include (2):

- Free access to education and employment.
- Freedom of expression and publication.
- Freedom of assembly and association.
- Freedom of movement and residence, including the freedom to attend international scientific meetings.
- Fair recognition for one's work.

There are continuing violations of these rights in many nations, and the situation in some of them is growing worse. The recent instances of serious persecution of scientists in nations such as Argentina (3), which had hitherto generally respected the human rights of scientists, demonstrate that there is unfortunately much that needs to be done in this area. Infringement of scientists' rights in any country should be of concern to citizens of all countries, since the success of any scholar's work depends as much on the freedom of others to study and do research as it does on his own.

Our subcommittee will act as a clearinghouse for information on foreign infringements of scientific freedom. We

21 JANUARY 1977

Our compact MM-33 micromanipulator drives by hand or motorized 'joy stick'.

Ideal for working at magnifications up to 250X, the MM-33 provides coarse movements in 3 planes (XYZ) plus fine movement in the thrust axis. Excursions calibrated in millimeters with vernier readings to 0.1 mm; final drive calibrated to 10 microns. Ball-bearing raceways assure smooth, backlash-free operation. All controls aligned in same vertical plane permits use of several MM-33's side by side. Mounts on Flexbar or a variety of bases.

Also available in a motorized version (MM-33M), with 'Joy Stick' remote unit for vibration-free control of speed and direction. For literature, write: Brinkmann Instruments, Cantiague Rd., Westbury, N.Y. 11590.

Cut density gradient spin time with a Sorvall® RC-5 centrifuge and new SS-90 vertical rotor.

The Sorvall® RC-5 refrigerated superspeed centrifuge with a Rate Controller is ideal for density gradient work. The soft start and soft stop characteristics of the Rate Controller prevent mixing of the gradient at speeds between 0 and 1,000 rpm.

With this feature and the new Sorvall® SS-90 vertical rotor, the RC-5 provides high resolution with reduced spin times. The rotor holds the tube at a fixed angle of 0° while the gradient reorients from horizontal to vertical. This means the particle must travel only the width of the tube, not the length. It also improves resolution by increasing the surface area and reducing the depth of the starting zone. In fact, the K factor calculated for the ultracentrifuge swinging bucket rotor of comparable volume is 265, while the K factor for the SS-90 vertical rotor is 210. And since the SS-90 holds 8 tubes instead of 6, you can spin more total volume.

The Sorvall® RC-5 also features solid state speed and temperature control systems, direct reading tachometer and temperature gauge, and an instrument panel with convenient push-button controls. And it accepts RC-2B as well as RC-5 rotors. It is built with the high quality and attention to detail that have been characteristic of Sorvall® centrifuges for years.

For more information on the Sorvall® RC-5 centrifuge, just write Du Pont Instruments, Biomedical Division, Room 23708A, Wilmington, DE 19898

Burt's IQ Data

Nicholas Wade, in his article on Cyril Burt (News and Comment, 26 Nov., p. 916), stops short of concluding that Burt's IQ data were fraudulent and leaves open the possibility that his early work might be acceptable science. There are, it must be stated, extraordinary difficulties in obtaining information about any of the data or procedures on which Burt's reported correlations were based. The following quotations from Burt are typical: "... methods ... were described more fully ... in degree theses by the investigators named in the text" (1, p. 46); "... buried in inaccessible theses" (1, p. 46); "A fuller account of sources and calculations, with detailed tables, will be found in her [J. Mawer's] degree essay ... (filed at the Psychological Laboratory, University College)" (2, p. 85). There is no such essay filed; the same "essay" is also referred to by Burt as a "thesis," but no such thesis was submitted to the University of London.

Elsewhere Burt writes, "Some of the inquiries have been published in L.C.C. [London County Council] reports or elsewhere: but the majority remain buried in typed memoranda or degree theses" (2, p. 89); and "... the number examined was nearer a hundred and twenty than three" (3, p. 10). This unsatisfactory, to say the least, method of citation was employed by Burt throughout his career.

In 1912 Burt and Moore (4, p. 385) wrote: "The more important of our tests have recently been carried out . . . upon over a thousand children of other ages (6 to 14) and upon adults, upon children and adults both of different social status (chiefly from Liverpool slums or from Liverpool University), and of different nationality (chiefly Irish and Hebrew). The results may be shortly summarized as follows. Every test appears to differ with differences in race, status, and age. . . ." This bit of scientific reporting must be squared with the following quote from a 1939 article by Burt (1, p. 48): "The value and reliability of group testing . . . were demonstrated by Moore, Davies, and myself. . . . These were, we believe, the first investigations in this country in which the number of children tested ran into well over a hundred." The early Liverpool research came center stage in 1954, in a letter (5) written to a journal edited by Burt. The correspondent, concerned with questions of scientific priority, indicated that Burt and Moore's "printed reports . . . do not give the detailed tables. Are these still available?" The reply (6), jointly authored by Burt and "P. Durant," stated: "Mr. Moore, it is hoped, will himself publish a fuller account of his analysis in a forthcoming issue of this *Journal*" (6, p. 123). The fuller account was not published by Moore, who had vanished as a research contributor more than 35 years earlier.

Though accusations of fraud clearly should not be made without substantial evidence, Herrnstein's reaction to my remarks about Burt ("I find it hard to stay in my chair") seems extreme. The circumstances make it appropriate to quote from a letter written by Herrnstein to a reporter on 16 July 1973. The letter is in my file, as Herrnstein mailed a copy to me. Copies were also sent to the reporter's employer, to a number of psychologists, and to the president and dean of Harvard University. Herrnstein wrote:

Until Kamin started his campaign to discredit Burt, there was no hint that Burt was suspect . . . by . . . any . . . expert you might have consulted. You cannot verify this by asking them now, for their memories might deceive them. You can, however, look at the

Slash density gradient spin time with a Sorvall® OTD ultracentrifuge and new vertical rotor.

Sorvall® OTD ultracentrifuges with oil turbine drive and Automatic Rate Controller are ideal for density gradient work. The soft start and soft stop characteristics of the ARC and Reograd mode of deceleration prevent mixing of the gradient at speeds between 0 and 1,000 rpm.

With these features and the new Sorvall® vertical rotor, Sorvall® ultracentrifuges give high resolution with reduced spin times. The rotor holds the tube at a fixed angle of 0° while the gradient reorients from horizontal to vertical. This means the particle must travel only the width of the tube, not the length. It also improves resolution by increasing the surface area and reducing the depth of the starting zone. In fact, the K factor calculated for the highest performance ultraspeed swinging bucket rotor is 45, while the K factor for the Sorvall® TV865 vertical rotor is only 10.

The oil turbine drive eliminates failure-prone gears, belts and brushes. And Sorvall® OTD-50 and OTD-65 ultracentrifuges have self-contained cooling systems — eliminating problems with hard water as well as installation of plumbing, filters, valves and gauges. Both are built with the high quality and attention to detail that have been characteristic of Sorvall® centrifuges for years.

For more information on Sorvall® OTD ultracentrifuges, just write Du Pont Instruments, Biomedical Division, Room 23707A, Wilmington, DE 19898

OSMETTE™

POSSIBLY THE MOST USEFUL INSTRUMENT YOU AREN'T USING!

The freezing point osmometer is one of the most simple, reliable and precise research tools available. It measures one of the colligative properties of solutions (freezing point) to 0.001°C, routinely. This is directly translated to a measure of concentration — with precision to 0.2%.

Some wise investigators are using the osmometer for such useful purposes as:

- Controlling concentration of buffer, alcohol, protein, salt and other solutions.
- Controlling concentration of electron microscopy stains such as osmium tetroxide, uranyl acetate, lead citrate, etc.
- Q.C. of tissue culture media.
- Maintaining desired salinity level for marine studies.
- Monitoring renal function tests.
- Sensing fluctuations in mineral corticoid hormone activity.
- Observing pharmacological effects of diuretics.
- Molecular weight determinations.

If you aren't using an osmometer in your laboratory, or if you need a new one, get the facts about Precision Systems' OSMETTES. They are the simplest, fastest, most reliable, most precise, and most economical osmometers available anywhere—and can be one of the most useful instruments in your laboratory. There are three models to suit varying workloads, or use requirements.

Write or call today for descriptive literature, or to arrange a demonstration.

Fig. 1. Correlation coefficients for "intelligence" test scores from 52 studies. Some studies reported data for more than one relationship category; some included more than one sample per category, giving a total of 99 groups. Over two-thirds of the correlation coefficients were derived from IQ's, the remainder from special tests (for example, Primary Mental Abilities). Midparent-child correlation was used when available, otherwise mother-child correlation. Correlation coefficients obtained in each study are indicated by dark circles; medians are shown by vertical lines intersecting the horizontal lines which represent the ranges.

public criticisms of Jensen and me prior to Kamin's revelations and you will find no bad word about Burt's data. Burt was . . . widely considered a person of unimpeachable integrity.

Kamin's assault is as yet unpublished, but I have heard his talk. There was nothing in it to persuade me that Burt was a "cheat," but if Kamin really told you what your article says he said then Kamin is surely a cheat.

The reporter had quoted my critique of Burt accurately. Herrnstein was correct in asserting that no experts—some now described as "early doubters of Burt's data"—had said a bad word. To me it seems apparent that Herrnstein is more concerned with protecting the good name of dead hereditarians than that of his living critics. This, I think, is reflected in Herrnstein's analysis of the data. To readers of Herrnstein's review (7) of the IQ literature I recommend, for quite a different perspective, my own book (8).

The errors—or whatever they are—in Sir Cyril Burt's heritability data have attracted a great deal of attention recently. Much of what has been written about the matter in both scientific jour-

nals and the popular press appears to assume that what is at stake is not just Burt's reputation, but the basic underpinnings of the view that intelligence has a large genetic component. Such a conclusion is unwarranted. The data demonstrating the heavy dependence of IQ on genetic factors are far too solid to be shaken by the rejection of the work of any single investigator—even Sir Cyril Burt.

Figure 1 is reproduced above as it appeared in *Science* in 1963 (1, p. 1478), except that arrows have been added to indicate the data points based on Burt's work (2). As is readily apparent, the deletion of Burt's data would have no appreciable effect on the overall picture. Note that Burt's figures differ from the median values of the many authors in an unsystematic way. The most likely hypothesis to account for the flaws in Burt's tables is one mentioned in Wade's article—being familiar with the literature and realizing that a few erroneous values wouldn't change things much, the aging Burt regrettably took the shortcut of repeating correlations he had calculated earlier rather than taking the trouble to compute new ones.

Reviews of Science

Philip H. Abelson
Series Editor

AAAS brings you outstanding publications on the critical issues of today . . . a series of Compendium Volumes that includes authoritative articles originally published in SCIENCE — articles you would have clipped for future reference if you knew then what the critical issues of today would be — articles you will want to assign your students for background reading, or use to supplement your own professional library. . . . Each compendium is available in your choice of casebound or paperbound edition. Order one—or all of them—today!

ENERGY: Use, Conservation, and Supply

A collection of enduring and readable articles on problems in the use of energy for food production and distribution; the potential of oil, coal, gas, and uranium for meeting present and future energy needs; long-term optional energy sources such as geothermal and solar energy and the possible use of methanol as a supplement to or substitute for dwindling gasoline supplies. This compendium provides a wealth of information for individuals as well as those in industry.

POPULATION: Dynamics, Ethics, and Policy

The ethics of choice . . . the interrelationship of population size and economic development . . . the consequences of population growth—such are the issues debated in this collection of outstanding articles, research reports, and policy debates. The papers provide a close look at population research as conducted and reported by American scientists, as well as a glimpse at the continuing debate between those who advocate different methods of contraception and population control.

FOOD: Politics, Economics, Nutrition, and Research

This report is essential reading for everyone concerned with the serious problems we face in meeting the world's food needs. It contains thirty-one articles on the perspectives and politics of the world food situation, the nutritional aspects of world food problems, and the impact of agricultural and biological research on food production and availability. Together these articles provide a provocative reassessment of the worldwide food crisis and a realistic look at our options for the future.

MATERIALS: Renewable and Non-renewable Resources

An important exploration of the new set of realities affecting the flow of raw materials. This compendium probes the implications of national policy, energy constraints, environmental considerations on materials production and use, the perspectives in needs and supplies of resources, high technology materials, and renewable and reusable resources. Essential reading for everyone concerned with materials issues and their import for the health of industrial economies, the future of materials research, and, ultimately, the quality of life.

Price for each Compendium: Retail: \$12.95 casebound, \$4.95 paperbound; AAAS Member: \$11.95 casebound, \$4.45 paperbound.

Large-scale experimental measurements by the Research Laboratories at General Motors have helped answer an important question in atmospheric science.

Predictions by some scientists had suggested that sulfate emissions from catalyst-equipped cars might reach dangerous levels by 1985. An unlikely occurrence—only under rare atmospheric conditions and if most cars have catalytic converters—but still a possibility, they said.

To get hard data, the Research Labs set up "The Great Sulfate Experiment." It was a public test—with the Environmental Protection Agency and other government and university researchers joining in.

Scientific evidence was gathered at the GM Proving Ground by simulating 1985 traffic. During 17 days, a test fleet of 352 catalyst-equipped cars rolled past our six testing towers, creating rush-hour traffic densities of 5,462 vehicles per hour.

During this time, sampling for sulfates and meteorological data took place at 20 points above and at ground level.

The finding: Roadway sulfate emissions are sent aloft by the turbulence and heat generated by vehicles.

It was a key discovery. Atmospheric scientists are now scrapping some old models of dispersion from roadways and drafting new ones based upon this unique data.

What's more, today's catalytic converter system—the best solution we now know for changing some other exhaust pollutants into harmless gases—is still free to do this important job.

If you would like more information on the experiment and its findings, we welcome your inquiry.

The great sulfate experiment.

Science in the Ford Years: Last Things

In the short and troubled Ford presidency, one would have expected the affairs of science to take a back seat. The main issues in that harassed interregnum concerned the stumbling national economy, the low estate of government, and general malaise and drift in the country's sense of purpose. If the Ford Administration was to woo any constituency, the scientific community logically would be about the last on the political list.

But politics and the making of public policy are strange and baffling arts. The departing President, a Midwesterner trained for the law and politics, and lacking any visible reason to care about the advancement of science, has turned out to be its good friend. Mr. Ford leaves a considerable legacy in the form of a statutory expression of national policy toward science and technology, the makings of a White House science policy center, and a research and development budget that provides for sensible growth and variety. There is a wryness in the fact that his political exit coincides with America's sweep of Nobel honors.

True, not everything is in order. The state of national affairs in energy decision-making is still dismal, if not disgraceful. The risks of nuclear proliferation seem more real than at any time in the recent past. The defense budget spirals upward while arms control agreements stumble and falter. There is no progress in negotiating the Law of the Sea. Technological innovation in the industrial sector is far from what it could be. Developing countries face frightening contingencies in meeting the needs of their people and dousing the incendiary potential of their rising dissatisfactions.

Even so, it must be said that a battered presidency alone could hardly surround and settle that formidable agenda. Our failures of resolution are the common indictment of all of us, and presidential power cannot be exercised in a vacuum. Neither Mr. Ford's defeat nor Governor Carter's victory was decided on the basis of how these issues entered into the choice. Indeed, the evidence is that politicians run dreadful risks when they stake their political futures on championing scientific freedom and progress rather than on conventional politics. A Daddario in 1970 and a Hechler in 1976 could not win governorship campaigns despite outstanding work for science and technology in Congress. What James Symington got for all his defense of the National Science Foundation in the "MACOS* fracas" was a sound thumping in his home state. In none of these cases was there an observable gathering of the scientific and technical clans on behalf of their embattled defenders. No one should be shocked if, the next time science is ambushed, politicians look the other way.

Americans tend to smirk when the British Honours List appears each year and eclipses briefly the torrent of bad news. But it is a symbol of grace under stress, and it might not do us any great harm to find civilized ways for expressing thanks for substantial public service. It should not be necessary to accumulate a thousand years of history to see that there is no shame in gratitude, and that it need not be pretentious.

There is a stir in the coatrooms of Washington. A government is retiring and a government is entering. The continuity of the political seasons unfolds as it has been ordained, and there is a touch of fever in the anticipation of things to be. But as the Gerald Fords, Guy Stevers, Charles Moshers, and James Symingtons take leave, let them know that their going is noted respectfully and their efforts remembered. If in years to come, science brings something of value to the relief of the human condition, it will not only be because of its own drive, but also because there have been public servants who did not stop to count the votes before putting the advancement of knowledge first.—WILLIAM D. CAREY

*"Man: A Course of Study." See J. Walsh, *Science* 188, 426 (1975).

Sartorius proudly introduces "affordable" electronic weighing; a completely new series of compact, fully electronic balances in the most popular weighing ranges, priced from \$1,895.

The new Series 3700 balances have no beam, no knife edges, no knobs, no dials and no mechanical zero adjustment. To weigh, just place the sample on the pan; in 1-2 seconds the readout is shown on a large, bright 7-segment digital display. Just touch the sensor bar for instant electronic taring (or zero adjustment) over the entire weighing range.

Other advanced features of the Series 3700 include a unique "stable reading" indicator and an electronic filter to eliminate the effects of high frequency vibration. Analog and digital outputs permit interfacing

with printers, records, calculators and data processing equipment. Check this table for the cost of the model with the weighing range and readability you need. You'll be amazed at the savings (Model 3706 costs little more than comparable mechanical top loaders).

Model	Weighing Range	Readability	Price
3705	0-160g	0.001g	\$2995
3704	0-1200g	0.01g	2995
3716*	a) 0-120g	a) 0.01g	2295
	b) 0-1200g	b) 0.1g	
3706	0-1200g	0.1g	1895
3703	0-3000g	0.1g	2295
3709	0-600g	0.01g	2330

*Dual Range Other models available with time integrator.

For an informative folder on these revolutionary balances, write: Sartorius Balances Division, Brinkmann Instruments, Inc., Cantiague Road, Westbury, N.Y. 11590.

The first fully electronic balances with the accuracies you want, in the ranges you need, at a price you can afford. Sartorius Series 3700.

SCIENCE FILM FESTIVAL

TOURS

New Rules for AAAS-Newcomb Cleveland Prize

The AAAS-Newcomb Cleveland Prize, which previously honored research papers presented at AAAS annual meetings, will henceforth be awarded annually to the author of an outstanding paper published from September through August in the Reports section of *Science*. The first competition year under the new rules starts with the 3 September 1976 issue of *Science* and ends with that of 26 August 1977. The value of the prize has been raised from \$2000 to \$5000; the winner also receives a bronze medal.

To be eligible, a paper must be a first-time presentation (other than to a departmental seminar or colloquium) of previously unpublished results of the author's own research. Reference to pertinent earlier work by the author may be included to give perspective.

Throughout the year, readers are invited to nominate papers

appearing in the Reports section. Nominations must be typed, and the following information provided: the title of the paper, issue in which it is published, author's name, and a brief statement of justification for nomination. Nominations should be submitted to the AAAS-Newcomb Cleveland Prize, AAAS, 1515 Massachusetts Avenue, NW, Washington, D.C. 20005. Final selection will rest with a panel of scientists appointed by the Board of Directors.

The award will be presented at a session of the annual meeting at which the winner will be invited to present a scientific paper reviewing the field related to the prize-winning research. The review paper will subsequently be published in *Science*. In cases of multiple authorship, the prize will be divided equally between or among the authors; the senior author will be invited to speak at the annual meeting.

Reports

Azaarenes in Recent Marine Sediments

Abstract. *Chemical fractionation and mass spectral probe distillation reveal the presence in recent marine sediments of a complex assemblage of nitrogen-containing aromatic compounds. These azaarenes range from three- to eight-membered rings, with homologs containing up to eight alkyl carbons. In their composition, and presumably in their origin in natural fires, they resemble the aromatic hydrocarbons found in the same sediments. The analytical, geochemical, and environmental implications of these findings are discussed.*

Soils and recent marine sediments contain a complex assemblage of polycyclic aromatic hydrocarbons (PAH) together with thienologs and extended series of alkyl and cycloalkyl derivatives (1, 2). Nitrogen analogs of the PAH had not been discovered in these samples. If the PAH are formed pyrolytically, as has been suggested (2), they should of course be accompanied by similarly complex assemblages of azaarenes.

Recently we have discovered a rich source of azaarenes and of their alkyl analogs in curtisite and idrialite (3), two fossil hydrocarbon minerals thought to be formed from plant material by pyrolysis in deeply buried sediments. These minerals are hydrocarbon mixtures pure enough to require little chemical separation before mass spectral analysis. The fact that these minerals require so little preliminary treatment led us to suspect that any azaarenes that might be present in recent sediments at low concentrations may have been overlooked because they were lost during the extensive pre-fractionation.

A reexamination of our earlier mass spectra revealed an excess intensity at the $M + 1$ ion of the principal PAH components, over and above that expected from the isotope contributions alone. This, of course, is also the position of the intense molecular ions of the aza analogs of the individual arenes. We now have tested and modified our analytical procedure for optimum recovery of the azaarenes, using 1-azapyrene as a reference compound.

The work-up presented here follows the method of Giger and Blumer (1) for sampling, extraction, and initial separation by gel permeation chromatography on Sephadex LH-20. However, the removal of elemental sulfur on active copper is avoided, since it leads to some loss of aza compounds. The eluate from gel permeation is chromatographed from pentane on acidic silica gel (8 ml, containing 3 percent 1N HCl). A pentane eluate is discarded, and the arenes are collected in two fractions (benzene and benzene with 2 percent methanol, 20 ml each). The bases are then recovered with

35 ml of methanol containing 3 percent concentrated aqueous ammonia. This eluate is partitioned between water and benzene; the organic layer is dried over anhydrous sodium sulfate, evaporated, and chromatographed on a bed of alumina packed over silica gel (4 ml each, both with 3 percent water). Eluates of pentane and methylene chloride (20 ml each) are discarded, and the azaarenes are eluted in two fractions (methylene chloride with 10 and 40 percent methanol, 20 ml each). These last eluates are combined, dried, and redissolved in benzene containing 20 mg of picric acid. After evaporation at room temperature in a rotary evaporator, the solids are washed three times with 2 ml of pentane; the washings are discarded. The remaining solids are dissolved in benzene and washed in a separatory funnel three times with 5 percent aqueous ammonia. The benzene layer is washed with water, dried, evaporated, and chromatographed over alumina (5 ml with 1 percent water). A 10-ml pentane fraction is discarded, and the azaarenes are eluted with 40 ml of pentane containing 60 percent methylene chloride.

The azaarene fraction is weighed and fractionally distilled from a capillary with a restricted opening (4) into the source of a mass spectrometer (Finnigan 3200) operated at 12 ev. Individual spectra, acquired on a Finnigan model 6000 data system, are inspected for the presence, appearance, and disappearance of homologous aza series. Because of the changing vapor composition during the distillation, individual spectra do not represent the true composition of the total samples. However, successive addition of all spectra that contain appreciable aza components reconstructs a spectrum that is representative of the total sample composition.

Few azaarenes and alkyl derivatives of

-76°C Ultra-Cold. -96°C Ultra-Colder.

Both from Kelvinator Commercial. Upright drops to -76°C . Ultra-cold. Chest model dips to -96°C . Ultra-colder. Upright's six French doors open individually. And you can label each door to know what's inside. Easy labeling for what's under the chest's stainless steel sliding lids, too. Want more? Automatic alarm systems? 2" portholes for recorders? The Kelvinator Commercial name? You got them. Don't be caught in the cold without ultra-cold. Contact J. E. Hirssig at Kelvinator Commercial, the company that knows how to give you 12 cubic feet of the best cold you ever had.

L-[1- ^{14}C] ORNITHINE 40-60mCi/mmol

Caution: Not for use in humans or clinical diagnosis

This new product is ideally suited to measure L-ornithine decarboxylase, the initial enzyme in polyamine biosynthesis.⁽¹⁾ The enzyme activity is pyridoxal-5'-phosphate dependent, and can be used as a measurement of vitamin B₆ levels in a variety of tissues and body fluids.⁽²⁾

Don't settle for half the literature loaf.

Now you can get the "whole" loaf with **BioResearch Index (Biol)**. Certainly **BIOSIS** selects, abstracts and indexes more than 140,000 primary journal articles every year . . . but there's more to life science literature than that. Much more.

In **Biol** we meticulously search and report on—

- Research Communications • Notes
- Reports • Symposia • Proceedings
- Meeting Abstracts • Monographs

These add up to 100,000 items which appear each month in **Biol** from thousands of sources.

You can leisurely browse the contents pages or quickly find special interests indexed by—

- Subject • Author • Field of Interest
- Organism (Biosystematic/Generic).

See what's in the oven throughout the entire world. Write or call today for full subscription information: **BioSciences Information Service of Biological Abstracts, Inc., Marketing Bureau, 2100 Arch Street, Philadelphia, Pa. 19103, U.S.A.**

Anyway you shake it... we make it

Gyrate, reciprocate, aerate and incubate! Just about every conceivable shaking requirement can be satisfied by NBS. Select from a full range of shaking equipment: water bath and incubator shakers, Gyrotory, reciprocating and twist-action shakers. You'll find them all in the most extensive shaker catalog ever published.

The CRC Labwasher: Save when you buy it, Save when you use it.

Save Money

Priced 15-30% lower.
And save on reduced
glassware breakage.

Save Time

Pays for itself in less than
6 months in an average
three-man laboratory.

Save Labor

Accommodates glassware
requirements of as many
as 10 personnel.

Efficiency Plus

Distilled or tap water rinse on
any or all three rinse cycles
with booster heater to raise
water temperature to 70°C
(160°F) during final rinse.
Drying time variable, 0-60
minutes. Under counter, free
standing or mobile models
available with 15 stainless
steel racks.

Omega Dot Glass Tubing

Consistent Quality —
Proven Performer

Omega Dot tubing is
now available from
stock in small or
large quantities made
from KG-33 or 7740
heat resistant glasses
in shapes as shown
in O. D. sizes of 1.0,
1.2, 1.5 mm; 2.0 mm,
1 to 4 barrels.

All sizes available
cut to 4" lengths or
lengths to 4'; 100
micron Omega Dot
glass fiber, as well
as all multiple bore
tubes, is glass to
glass welded for con-
sistent electrode tip
pulling and ease of
filling.

Special sizes not
shown promptly
made to your specs.
Samples and prices
available.

We welcome the op-
portunity to work
with you.

EPOI air-mounted vibration isolation systems are no great shakes.

No small shakes either. No shakes at all.
EPOI Vibration Isolation Tables protect your
vibration-sensitive instruments—such as
microscopes, mask alignment system,
balances, thermal analyzers, mass spec-
trometers, lasers, and micro-positioners—
from vibration you may not even realize
exists. Vibration may be the force that
causes mysterious inaccuracies and
malfunction of your finest instruments.

You need to know more about vibration and
how to protect your equipment from it. Find
out what you need to know in our EPOI
Vibration Isolation Table information
kit. In it are details on how and
why vibration affects you in
ways that may be more costly
than you realize.

VIT will shake up your thinking.

BARRIER FREE MEETINGS

a guide for professional associations

- Do you attend meetings?
- Do you arrange meetings?
- Do you host meetings?

Do some people who should be at your meetings encounter barriers to their attendance? Then **BARRIER FREE MEETINGS: A Guide for Professional Associations** is a AAAS publication you need.

BARRIER FREE MEETINGS, produced by the AAAS Project on the Handicapped in Science, is based on our experiences at the 1976 AAAS National Meeting. We removed barriers for our physically disabled colleagues—to the benefit of all attendees—and we can show you that making a meeting accessible is not that difficult.

The **Guide** gives you step-by-step directions on how to provide easy access to all phases of a meeting. A detailed time-line takes you through the four basic stages of meeting planning: *Initial Preparation*, to *Pre-Meeting Activities*, through *The Meeting* itself and the essential *Follow-Up*. Appendixes provide many examples of forms, publicity pieces, resource lists, and drawings that illustrate accessibility modifications for meeting facilities.

Join us
MAKE YOUR MEETINGS ACCESSIBLE TO ALL YOUR MEMBERS

The **Guide** is available for \$4.00 per copy; \$3.75 to AAAS members. (Checks payable to AAAS.)
Remittance must accompany orders under \$5.00.)

Send your order (and your name and address) to:
