1977 AAAS-Westinghouse

SCIENCE WRITING AWARDS FOR

NEWSPAPERS AND MAGAZINE

SCIENCE WRITING.

RULES

1) The aim of this competition is to encourage and recognize outstanding writing on the sciences and their engineering and technological application in newspapers and general circulation magazines. The following categories are not eligible: articles on the field of medicine, articles published originally in AAAS publications, articles by employees of the AAAS or Westinghouse Electric Corporation.

2) Each entrant in a newspaper award competition and each entrant in the magazine award competition may submit three entries.

3) An entry for a newspaper competition may be any of the following: a single story; a series of articles; or a group of three unrelated stories, articles, editorials, or columns published during the contest year. A magazine entry may be a single story or series published during the contest year.

4) A completed entry blank must be submitted together with five copies of each entry in the form of tear sheets, clippings, reprints, or syndicate copy (not over 8½" x 11"), showing name and date of the publication. **ENTRIES MUST NOT BE ELABORATE.**

5) Each entry must have been published in a newspaper or general circulation magazine within the United States during the contest year — 1 November 1976 through 31 October 1977. (In the case of a series, more than half of the articles comprising it must have been published during the contest year.) Date on the issue in which an article appeared will be considered as the date of publication. All entries must be postmarked on or before midnight, 15 November 1977.

6) Persons other than the author may submit entries in accordance with these rules. Entries will not be returned.

7) Winners of the 1976 awards are not eligible for the 1977 awards. Persons winning three times are no longer eligible.

8) The Judging Committee, whose decisions are final, will choose the winners. There are three awards of \$1000: for the winning entry in the over-100,000 daily circulation newspapers competition, for the winning entry in the under-100,000 circulation newspapers competition; and for the winning entry in the general circulation magazine competition. For award purposes, newspaper circulation will be sworn ABC daily circulation as of 30 September 1977. The Judging Committee may cite other entries for honorable mention.

9) The awards will be presented at the dinner meeting of the National Association of Science Writers, during the 1978 meeting of the American Association for the Advancement of Science in Washington, D.C. Travel and hotel expenses of the award winners will be paid. Entrants agree that, if they win, they will be present to receive their awards, unless prevented by circumstances beyond their control.

WHAT'S BETTER THAN SPEED READING?

SPEED LEARNING

(SPEED PLUS COMPREHENSION)

Speed Learning is replacing speed reading because it's easy to learn . . . lasts a lifetime . . . applies to everything you read . . . and is the only fully accredited course with the option of 3 college credits.

Do you have too much to read and too little time to read it? Do you mentally pronounce each word as you read? Do you frequently have to go back and re-read words or whole paragraphs you just finished reading? Do you have trouble concentrating? Do you quickly forget most of what you read?

If you answer "yes" to any of these questions — then here at last is the practical help you've been waiting for. Whether you read for business or pleasure, school or college, you will build exceptional skills from this major breakthrough in effective reading, created by Dr. Russell Stauffer at the University of Delaware.

Not just "speed reading" — but speed reading-thinking-understanding-remembering-and-learning

The new *Speed Learning Program* shows you step-by-proven-step how to increase your reading skill and speed, so you understand more, remember more and use more of everything you read. The typical remark made by the 75,000 slow readers who completed the *Speed Learning Program* was: "Why didn't someone teach me this a long time ago?" They were no longer held back by the lack of skills and poor reading habits. They could read almost as fast as they could think.

What makes Speed Learning so successful?

The new *Speed Learning Program* does not offer you a rehash of the usual eye-exercises, timing devices, costly gadgets you've probably heard about in connection with speed reading courses or even tried and found ineffective.

In just a few spare minutes a day of easy reading and exciting listening, you discover an entirely new way to read and think — a radical departure from any-

thing you have ever seen or heard about. Research shows that reading is 95% *thinking* and only 5% eye movement. Yet most of today's speed reading programs spend their time teaching you rapid eye movement (5% of the problem) and ignore the most important part (95%) *thinking*. In brief, *Speed Learning* gives you what speed reading *can't*.

Imagine the new freedom you'll have when you learn how to dash through all types of reading material at *least* twice as fast as you do now, and with greater comprehension. Think of being able to get on top of the avalanche of newspapers, magazines and correspondence you have to read . . . finishing a stimulating book and retaining facts and details more clearly and with greater accuracy than ever before.

Listen-and-learn at your own pace

This is a practical, easy-to-learn program that will work for you — no matter how slow a reader you think you are now. The *Speed Learning Program* is scientifically planned to get you started quickly . . . to help you in spare minutes a day. It brings you a "teacher-on-cassettes" who guides you, instructs, encourages you, explaining material as you

read. Interesting items taken from *Time Magazine*, *Business Week*, *Wall Street Journal*, *Family Circle*, *N.Y. Times* and many others, make the program stimulating, easy and fun . . . and so much more effective.

Executives, students, professional people, men and women in all walks of life from 15 to 70 have benefited from this program. Speed Learning is a fully accredited course . . . costing only 1/5 the price of less effective speed reading classroom courses. Now you can examine the same, easy, practical and proven methods at home . . . in spare time . . . without risking a penny.

Examine Speed Learning FREE for 10 days

You will be thrilled at how quickly this program will begin to develop new thinking and reading skills. After listening to just one cassette and reading the preface you will quickly see how you can achieve increases in both the speed at which you read and in the amount you understand and remember.

You must be delighted with what you see or you pay nothing. Examine this remarkable program for 10 days. If, at the end of that time you are not convinced that you would like to master Speed Learning, simply return the program and owe nothing. See the coupon for low price and convenient credit terms.

In most cases, the entire cost of your Speed Learning Program is Tax Deductible.

EARN PROFESSIONAL & COLLEGE CREDITS

Speed Learning is approved for credit by the following professional and educational institutions:

- AMERICAN MEDICAL ASSOCIATION
15 Credit Hours — Category I
Louisiana State University Medical Center
- FOUNDATION FOR ACCOUNTING EDUCATION
20 Continuing Professional Education Credit Hours
- COLLEGE CREDIT
3 credits from the National College of Business

Details and registration forms included with each program. Note: Many firms and government agencies have tuition assistance plans for employees providing full or partial payment for college credit programs.

ENDORSED BY

- American Management Associations
- Institute of Electrical & Electronics Engineers
- 1000s of executives, physicians and educators

learn
INCORPORATED

COVER

Nocturnal sand-dwelling scorpion (*Paruroctonus mesaensis*) exhumes burrowing cockroaches it locates by sensing compressional and surface waves generated by the prey's movements in sand. Photograph was taken under ultraviolet light at night. See page 479. [P. Brownell, D. McFarland, and R. Farley, University of California at Riverside]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

FINAL SALE

We've drastically reduced prices on all 1969-1975 AAAS annual meeting audiotapes. Our sale prices are \$12 a session for cassette recordings or \$6 a session for open reel tapes. Quantities are limited, so send your order in now.

Other tapes available at these reduced prices are listed in the 1976 AAAS audiotapes brochure.

Biological Sciences

- **Chemical and Biological Warfare** (One Session) 32-69.
- **Human Cell Biology: Scientific and Social Implications** (One Session) 64-70.
- **Separation and Depression: Clinical and Research Aspects** (Sessions I-III) 84-70.
- **Effects of Large-Scale Use of Herbicides and Defoliants** (Sessions I-II) 86-70.
- **Physics Looks at Biological Structure** (Sessions I-II) 98-71.
- **Genetic-Physiological Approaches to Animal Improvement** (One Session) 121-72.
- **Genetic Vulnerability of Crops** (One Session) 126-72.

Landsat's Role in Brine Discovery

In his Research News article of 29 April "Remote sensing (I): Landsat takes hold in South America" (p. 511), Allen L. Hammond attributes the recent discovery of lithium- and potassium-rich brines in Bolivia to analysis of Landsat imagery. This statement should be clarified. The brines were discovered in Salar de Uyuni, which is a 9000-square-kilometer salt pan in the southern part of the Bolivian Altiplano and the largest hard, flat surface on Earth. The suggestion that lithium- and potassium-rich brines might occur in this salar was first made in a paper (1) presented at a symposium on lithium in Denver in January 1976. The paper was based primarily on an evaluation of the environment of lithium- and potassium-rich brines in salars of nearby northern Chile. As a consequence of this work, brine samples were collected by a Landsat team that visited Salar de Uyuni in April 1976 for the purpose of gathering data about the salar surface to aid in interpreting patterns recorded by Landsat. Two samples collected and analyzed in laboratories of the U.S. Geological Survey proved to be high in lithium and potassium.

Nighttime Driving Accidents and Selective Visual Degradation

It has been established that the incidence of serious traffic accidents, particularly those involving pedestrians, increases at night (1). While variables such as fatigue and drinking behavior are more prevalent at night, and variation in traffic flow may be important, the striking reduction in the nighttime accident rate as a result of illuminating highways argues for the importance of vision (2). In view of the significance of visual factors, the influence of low illumination on specific aspects of driver performance merits further attention. In this context, the recent emphasis on multiple modes of visual information processing provides a heuristic basis for analyzing the driver's perceptual-motor tasks (3-5). According to this point of view, visual processes can be dissociated into at least two subsystems. "Focal" vision is mediated primarily by the central retina and

suberves form perception (identification), while "ambient" vision is mediated primarily by the peripheral retina and provides information regarding spatial localization. These processes differ with respect to their subserving neurological structures (3), modifiability (4-5), sensitivity to blur (6), degree of consciousness, temporal courses, and luminance response characteristics (7-8), all of which suggest physiological as well as behavioral dissociation of function.

Held (4) has suggested that localization and mobility in space are primarily dependent on the ambient peripheral system, and Dichgans and Brandt (9) have shown that peripheral vision is of great importance, both for the perception of body orientation and motion and for the control of posture. Since the automobile driver's primary task, which demands his immediate and continuous attention, is dynamic spatial orientation, one would expect this activity to be mediated mainly by the peripheral retina. It has been established that peripheral localization is independent of target luminance (7), that resolution acuity in the periphery is relatively unaffected by optical blur (6), and that dynamic spatial orientation is independent of both luminance and refractive error. Thus, there should be relatively little degradation of performance of the ambient system with lowered illumination. The driver should suffer little or no loss of steering ability under low illumination and his self-confidence should remain high. Therefore, he might neglect taking appropriate precautions at night. Such behavior is consistent with reports that drivers generally do not reduce their speed at night and with clinical observations that many individuals with central scotomata continue to drive (10).

In contrast with the relatively high level of performance of the ambient system, the performance of the focal (form identification) system is seriously degraded under low illumination. Major visual functions, such as resolution acuity, contrast sensitivity, and stereoscopic depth perception, are reduced substantially at lower luminance levels. In addition, darkness-induced refractive errors or "night myopia" will, for many individuals, increase the blur of the optical image and further reduce performance for those functions requiring a sharp retinal image (11). Such blurring will also hinder the detection of dim stimuli (12), which is of great importance to the driver at night. While some stimuli containing important information, such as pavement markings, road signs, and other traffic, are usually sufficiently illuminated to be easily seen under favorable weather condi-

tions, other less predictable but equally important stimuli, such as pedestrians, cyclists, and disabled vehicles, are often only dimly illuminated, resulting in hazardous situations. Due to the blurring as a result of night myopia, the detection and recognition of such dimly lit obstacles may be delayed until the braking or evasive maneuvers necessary to avoid an accident are impossible.

Since the major tasks of driving are relatively unimpaired by reduced illumination, the driver does not anticipate and is not prepared to deal with stimuli for which the focal system suffers a selective deficit. In effect, the driver is unjustifiably reassured by the high performance level of the dynamic spatial orientation system and is unaware of a loss in focal visual abilities. Since the visual deficit is only partial and of consequence only for low-probability stimuli, the driver is unaware of the loss of function and does not take the necessary precautions. In contrast to such naive overconfidence, drivers who are aware of their visual loss, such as those with incipient cataracts (13) or with small pupils associated with glaucoma therapy, are reluctant to drive at night.

Several precautions can be taken to improve this situation. An obvious one would be to increase the visibility of unexpected obstacles by continued efforts to improve roadway illumination and by increased usage of highly reflective markings. A more general and presently unused measure would be to screen drivers for night-time as well as daytime visual performance and to optimize their abilities by providing optical corrections at night when necessary. In the past, the cause and correction of night myopia have been topics of some controversy. However, recent studies from this laboratory, which attribute night myopia to a shift in ocular accommodation toward the individual's resting or dark-focus (*Akkommodationsruhelage*), suggest a simple method for counteracting the loss of image clarity at night. An evaluation of the dark-focus with a laser optometer has permitted us to recommend an individually determined optical correction specifically for night myopia which substantially improves form perception under both laboratory and field conditions (14). In a small sample of college students, this correction was found to improve visual acuity by as much as 25 percent under simulated night-time driving conditions; similar improvements for the detection of weak stimuli would be expected. At highway speeds this added margin of visibility could weigh heavily in the interest of accident prevention. It is hoped that awareness by drivers and

traffic safety authorities of the selective nature of the visual losses at night will provide the basis for measures to reduce the appalling frequency of accidents at night.

Is Small Always Beautiful?

I would like to add one more note to the many that have undoubtedly been received concerning the use of natural gas, uncoated, nonglossy paper, or coated paper in the production of *Science*. In the 1 April issue the increased costs related to using the uncoated paper were provided, not the least of which is the environmental impact of producing the extra 16 tons of paper required for the 11 February issue. By imposing the single criterion of "low cost," it has been determined that a coated, glossy paper should be used. The significant point is that these coated papers are the result of "high technology."

Thus we have a dramatic example that the "small is beautiful" philosophy and its "intermediate technology" do not always provide the best solution; nor do they implicitly improve the quality of life, save natural resources, or protect the environment.

CHARLES C THOMAS • PUBLISHER

MULTIPLE SCLEROSIS — SCARS OF CHILDHOOD: New Horizons and Hope by John M. Adams, *UCLA School of Medicine, Los Angeles*. Foreword by Robert A. Good. While written in a manner comprehensible to the layman, this book contains information that will interest researchers, therapists, students and physicians. The relationship of MS to common childhood diseases such as measles and chicken pox is explored, as are its climatic and geographical correlations, genetic determinants, immunologic aspects and therapeutic possibilities. '77, 96 pp., 1 il., \$8.95, paper

BOTULISM: The Organism, Its Toxins, The Disease by Louis D. Smith, *Virginia Polytechnic Institute and State Univ., Blacksburg*. Virtually every aspect of the bacteria that cause botulism and the disease itself are covered in this book. Chapters discuss the organism, its natural occurrence, bacteriocins and bacteriophages that affect their growth and toxin production, heat and radiation resistance of their spores, and the susceptibility of different species to the various toxins. The incidence and characteristics of botulism are described and methods of control are given. '77, 256 pp., 3 il., 37 tables, \$18.75

THE PRACTICAL USE OF THE MICROSCOPE: Including Photomicrography (2nd Ptg.) by George Herbert Needham. This work includes descriptions and critical evaluations of the many types of microscopes, accessories and equipment. Ultramicroscopes, fluorescence microscopes, ultraviolet and reflecting microscopes, electron and polarizing microscopes all receive detailed attention. Other chapters focus on photomicrography, illumination, filters, crystal systems and other topics of interest to the microscopist. '77, 520 pp. (6 3/4 x 9 3/4), 292 il. (2 in color), \$21.50

ESSENTIALS OF BACTERIAL AND VIRAL GENETICS by David M. Carlberg, *California State Univ., Long Beach*. The author explores the genetic code, polypeptide synthesis and control, molecular biology of spontaneous and induced mutations, and characteristics and isolation of bacterial mutants. A general discussion of recombination is followed by coverage of transformation and conjugation in bacteria. Genetics of viruses, eucaryotic microorganisms, and the higher plants and animals are also included. '76, 336 pp., 166 il., 35 tables, \$24.75

SPRINGFIELD • ILLINOIS • 62717

A 73-year-old stuntman, Henri LaMothe, dives 35 feet into 13 inches of water. He does it regularly. Without harm. Now that says something about body toughness.

Once, in a less severe dive, our instruments went with him. And we found that his chest safely withstands "g" forces beyond those commonly thought to be injurious.

Learning about the impact response of the body is just one phase of our extensive biomedical research program at the General Motors Research Laboratories. The goal in this phase: Develop a better understanding of man's reaction and tolerance to collision forces.

To this end we have done mechanical response and trauma studies on the head, chest, and leg; on tissue; and on the body as a whole. We've also developed mathematical models of the man-car system for simulating crashes in a computer and predicting car occupant kinematics.

Another phase of our work concerns the health effects that may be related to GM products. It includes respiratory response to air pollutants, the dynamics of air flow in the lungs, and toxicity investigations.

The program in biomechanics started here some 15 years ago. It spawned the first energy-absorbing steering column put into production...a head-injury-severity index used by the United States Department of Transportation and football helmet designers...a sophisticated anthropomorphic test dummy.

Our biomedical research continues, through meaningful data, to promote GM's most important commitment to society: a safer, practical car and a healthier environment.

We're expanding the body of knowledge about the human body.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Science serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

Federal Reorganization: Science and Technology

As plans for the reorganization of the government are drafted and redrafted, rumors about changes in the organization of science and technology programs abound. It seems timely, therefore, to consider some general principles of organization and management in relation to science and technology in government which should be kept in mind as new arrangements are sought.

Mission agencies need strong R & D programs. The vast majority of federally supported R & D activities is intended to enhance specific policy goals. There are few policy missions, if any, that will not benefit from a well-designed research program. This includes research and development proper as well as policy and evaluation research. It also includes development of institutional linkages for diffusion and extension and, where appropriate, social demonstrations. Both programmatic and regulatory agencies need R & D activities directly related to their policy missions.

Mission agencies need their own science policies. There is no single model for organizing and managing an agency's R & D program, for the appropriate mix of private and public involvement, for the use of internal or external R & D capabilities, for establishing linkages between policy planning, program implementation, and the R & D function. What makes sense in the case of Defense is unlikely to work in Agriculture, and vice versa. Agencies must learn from each other, but there is no substitute for developing agency-specific R & D strategies in response to agency-specific responsibilities and environments.

Mission agencies need basic research. R & D programs of individual mission agencies must not be restricted to applied work or to exclusive concern with short-term solutions. Mission agencies, instead, must be organized and funded in such ways that they can support basic research in their broad areas of responsibility. Without such a policy the research work of agencies will become stale.

A central science policy capability is needed. Science advice for presidential decision-making will take on different organizational forms under different Presidents and for different issues. However, it would be a grave mistake if the need for a strong science policy capability had to be rediscovered every few years. The range of issues to be decided by the President, many of them with important scientific and technological components, requires a stable White House capability with access to the best available scientific and technical information.

Promotion and regulation should be separate. We have learned, over time, that the two functions of promoting and regulating innovation should not be kept under the same organizational roof. The recent congressional decision providing for separate organizations responsible for promotion of new energy sources and for regulation of safety and impact indicates the direction to follow.

Administrative controls must not become ends in themselves. There should be more emphasis on quality control of work proposed or completed and less concern with administrative red tape. With regard to quality control, recent studies support the claim that peer review ensures high standards of performance in scientific research. Agencies should extend the areas of funding decisions subjected to peer review. Other forms of administrative control tend to become counterproductive. There is disturbing evidence that increased reporting requirements and tacked-on civil rights and equal opportunity rules, however well intended, result in formalistic arrangements which endanger creativity and the willingness to take risks. Unless this trend can be reversed and a bond of mutual trust is rebuilt between those funding R & D activities and those performing these tasks, we will pay the same high price in reduced originality and productivity that other nations have paid before.—JURGEN SCHMANDT, *Lyndon B. Johnson School of Public Affairs, University of Texas, Austin 78712*

Reviews of Science

Philip H. Abelson
Series Editor

AAAS brings you outstanding publications on the critical issues of today . . . a series of Compendium Volumes that includes authoritative articles originally published in SCIENCE — articles you would have clipped for future reference if you knew then what the critical issues of today would be — articles you will want to assign your students for background reading, or use to supplement your own professional library. . . . Each compendium is available in your choice of casebound or paperback edition. Order one—or all of them—today!

ENERGY: Use, Conservation, and Supply

A collection of enduring and readable articles on problems in the use of energy for food production and distribution; the potential of oil, coal, gas, and uranium for meeting present and future energy needs; long-term optional energy sources such as geothermal and solar energy and the possible use of methanol as a supplement to or substitute for dwindling gasoline supplies. This compendium provides a wealth of information for individuals as well as those in industry.

POPULATION: Dynamics, Ethics, and Policy

The ethics of choice . . . the interrelationship of population size and economic development . . . the consequences of population growth—such are the issues debated in this collection of outstanding articles, research reports, and policy debates. The papers provide a close look at population research as conducted and reported by American scientists, as well as a glimpse at the continuing debate between those who advocate different methods of contraception and population control.

FOOD: Politics, Economics, Nutrition, and Research

This report is essential reading for everyone concerned with the serious problems we face in meeting the world's food needs. It contains thirty-one articles on the perspectives and politics of the world food situation, the nutritional aspects of world food problems, and the impact of agricultural and biological research on food production and availability. Together these articles provide a provocative reassessment of the worldwide food crisis and a realistic look at our options for the future.

MATERIALS: Renewable and Non-renewable Resources

An important exploration of the new set of realities affecting the flow of raw materials. This compendium probes the implications of national policy, energy constraints, environmental considerations on materials production and use, the perspectives in needs and supplies of resources, high technology materials, and renewable and reusable resources. Essential reading for everyone concerned with materials issues and their import for the health of industrial economies, the future of materials research, and, ultimately, the quality of life.

Sale price

Price for each Compendium: Retail: ~~\$12.95~~ casebound, ~~\$4.95~~ paperback; AAAS Member: ~~\$11.95~~ casebound, ~~\$4.45~~ paperback.
