SCIENCE

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Announcing the Beckman J2-21... a centrifuge you'll love.

The J2-21 is an exciting new high-speed centrifuge. It keeps the components that made the 21,000-rpm J-21C so reliable—and adds proven features from other Beckman centrifuges. The result: by far the finest high-speed centrifuge ever built.

The J2-21 features: a fast-accelerating, high-torque drive; variable power-braking system; superior sound suppression; easy temperature setting; new, automatic vacuum system; rotor imbalance detector; easy-opening counterbalanced door; compact cabinet; built-in speed calibration; 2°

to 40°C operation; electronic door interlock; and it is UL listed and CSA approved.

There are eleven J2-21 rotors to choose from, including the new JA-17 which spins fourteen 50-ml tubes, and the new JA-20.1 which spins thirty-two 15-ml tubes.

The J2-21: it gives you reliability, quiet efficiency unmatched by any other centrifuge, and it's backed by Beckman sales and service—worldwide.

Send for brochure SB-366 to Beckman Instruments, Inc., Spinco Division, 1117 California Ave., Palo Alto, CA 94304.

or this:

There are scores of journals that specialize in a science. But now for the first time, you can get a perspective on all the human sciences in a magazine that finds and publishes the latest information in these related fields.

Month after month, Human Nature gives you the best people in biology, genetics, psychology, linguistics, sociology, religion, education, health and medicine, paleontology, ecology, anthropology and cultural evolution.

You'll find fascinating articles such as *Divided Attention*, *Determinants of Health*, *Hypnosis and Consciousness*—and the latest thinking of scientists, including Robert Ornstein, Lewis Thomas, Rene Dubos and Jerome S. Bruner.

Human Nature—enormously intelligent, thoroughly literate, scientifically accurate, and illuminated by images of startling beauty and clarity.

Discover the riches of Human Nature

COVER

Body wave of a swimming leech, as seen in sequence (top to bottom) of successive movie frames taken at 35-millisecond intervals. The right-to-left horizontal displacement depicts the true forward progress of the animal. See page 1348. [W. H. Kristan, Jr., C. A. Ort, and G. S. Stent, University of California, Berkeley]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

Zeiss Standard Microscopes: the now and future value.

Now: Zeiss Standards designed for material and life sciences:

Industrial research, quality control, inspection;

Geology, petrography, and mineralogy;

Biomedical teaching and research;

Pathology and all clinical laboratory disciplines.

Future: long life — everything is precision engineered to fit and perform just as smoothly after years of use as it did on the first day, even under heavy daily laboratory work loads.

Now: Zeiss optics — the same ones we use on our large, much more expensive research microscopes.

Future: you can always add new objectives, light sources, stages, and accessories to any Standard — even 20-year old ones.

Now: low price — for example, a Clinical Standard costs less than \$1600.

Future: years of trouble-free, worry-free quality.

Nationwide service.

Carl Zeiss, Inc., 444 5th Avenue, New York, N.Y. 10018 (212) 730-4400. Branches in: Atlanta, Boston, Chicago, Columbus, Houston, Los Angeles, San Francisco, Washington, D.C. In Canada: 45 Valleybrook Drive, Don Mills, Ont., M3B 2S6. Or call (416) 449-4660.

For unattended water and ambient air temperature recording up to 180 days...

...the new Ryan Model J portable, waterproof thermograph!

Here's an ideal instrument for water resources studies, thermal pollution measurements, and fishery research projects . . . one that charts water or air temperatures with unattended scientific accuracy up to 6 months with the Model J-180, 3 months with the Model J-90.

Easy-to-read temperature changes are recorded by a fast response probe on a 2 inch by 24 foot pressure-sensitive strip chart, contained in a removable cartridge. Quartz mechanism provides precise movement. Ryan

Model J instruments are available for short-term rentals or purchase. Send this coupon for a free brochure:

With S&S collodion bags you don't lose your concentration.

S&S collodion bags and apparatus are an ideal system for concentrating proteins from cerebral spinal fluid, urine, and other body fluids. In addition, the S&S collodion bag system is used to concentrate strands of RNA or DNA.

Use S&S collodion bags and your fraction collects in the tip of the bag, all together for easy removal without loss. You achieve higher recoveries than with other methods of concentration and dialysis, especially dialysis tubing. S&S bags are ideal for *in vitro* diagnostic use.

You get more of your sample, too. S&S collodion bags are the only practical method on the market that lets you reduce solutions of protein to near-zero volumes. Each bag provides 10cm² of membrane filter surface. The S&S system permits the widest variety of sample volumes, from less than 10ml up to unlimited volumes using the S&S accelerator. Choice of three grades permits a range of MW retentions—10,000, 25,000 and 75,000. And you can withdraw as little as 10 μ l.

The S&S collodion bag system is faster, lets you dialyze and concentrate simultaneously under a vacuum, and permits you to recover the retentate for further investigation.

S&S collodion bags are inexpensive enough to use once and discard. They're sturdy enough to be cleaned

and re-used up to 10 times. The full line of apparatus making up the S&S system is inexpensive glassware. The S&S collodion bag accelerator reduces concentration times up to 43 percent, permits continuous concentration of large volumes, permits easy withdrawal of concentrate during dialysis.

For complete information and specifications send for Instructional Bulletin S-3. Your laboratory supply dealer should have the complete system—collodion bags and apparatus—in stock. You can well afford to be caught holding this bag.

Just a touch is all it takes to generate image analysis data.

In designing our image analyzer, we realized that many laboratories needed an image analysis system that would not require expertise in programming.

So we connected the Leitz® ASM (analysis system manual) to a microprocessor which we programmed for the automatic computation of many different parameters and distributions.

This makes the semiautomatic ASM much faster to use than the traditional point counting methods.

To select and change analysis programs, the user simply touches the relevant instruction field.

This prepares the ASM to measure the desired parameters or distributions.

A tracing panel is the interactive link between operator and machine.

5738

To generate data from various image components, the user just traces their contours with an electronic pen.

Parameters can be extracted from photographic negatives or prints or from microscopical images.

Magnification and various other constants can be inputted into the computation.

But don't be deceived by the remarkable simplicity of the ASM.

Linear dimensions, perimeters, areas, shape factors, projections, gravity center coordinates, various line and area moments, and stereological parameters of seven image phases can be computed simultaneously and outputted as values in absolute dimensions.

Image data can be printed

out for permanent record on an alphanumeric printer.

MAGNIFICATION:	+1.000000	
TOTAL ENTRIES:	31	
PHASE:	1	
PARAMETER:	11	
MEAN:	+28.038	
STD. DEV.:	+14.4483	
NUMBER OF ENTRIES:	31	
CUMMULATIVE DISTRIBUTION OF P11		
SEQU.	FREQUENCY (%)	ABS
1	+100.000000	+
2	+100.000000	+1

They are also displayed on the ASM control panel.

Because the ASM is a Leitz instrument, you can depend on it for reliable, precise performance.

So if you're taking a new look at image analysis, consider the new Leitz ASM.

130 pages of low prices, high quality & quick service

and
here's
just
one
of
them

Sending for RPI's new 1978 catalog could be the best thing you do for your budget all year. It gives you extra buying power because RPI's regular catalog prices are from 20% to 50% lower than you're likely to find anywhere else. And it gives you the most complete listing of high-quality products for life science research ever collected between 2 covers.

Now you can save on

- Liquid scintillation counting chemicals, fluors, vials and accessories including new cocktails, solubilizers & vials
- Monitoring instruments for alpha, beta, gamma & x-ray contamination and radiation
- Over 500 C-14 and tritium labeled compounds... 180 are exclusive
- Antisera for RIA, affinity chromatography, immunoelectrophoresis & immunodiffusion
- World's most extensive line of fluorometric & histochemical enzyme substrates
- Highest purity biochemicals available

Stringent controls—using today's most modern analytical methods—assure you of consistent high quality. A streamlined service system gives your order immediate attention the moment it's received. And carefully maintained inventories make it possible for RPI to ship virtually every order the same day it comes in.

Mail Coupon Today... see how RPI's new catalog can help you get more research for your money. If you need it *really* fast, give us a call.

Get ultraspeed performance at superspeed cost with the new Sorvall® RC-5B centrifuge system.

The Sorvall RC-5B Superspeed Refrigerated Centrifuge sets a new standard for range of applications. With the 12 rotors designed for it—including highly efficient vertical rotors*—it constitutes a versatile system that can do many jobs, such as density gradient studies, previously handled

only by more costly ultracentrifuges. A graphic example of the ultraspeed capabilities of the RC-5B with a vertical rotor is the comparison shown here, of separations achieved for a cowpea mosaic virus preparation.

The RC-5B has a built-in Automatic Rate Controller to provide soft starts and stops.

The electronics also includes automatic temperature, speed and time control. Sorvall Gyro Action Direct Drive requires only "eye balancing" of tube contents. Other features include easy programming, "fail-safe" control system and the unique "Noisuppressor" sound-damping system. And DuPont's 5-year warranty on refrigeration components is unmatched in the industry. A complete line of tubes, bottles and adaptors is available for the RC-5B.

Separation of Cowpea Mosaic Virus Particles (Yellow Strain)

Superspeed Centrifuge (RC-5B)
Vertical Rotor (SV-288)
Timer Setting: 4 Hours
Speed: 20,000 rpm

Ultracentrifuge (OTD-65)
Swinging Bucket Rotor (AH-627)
Timer Setting: 5 Hours
Speed: 27,000 rpm

Rate-zonal separations using 1-ml sample volumes.
10-40% sucrose gradients (33 ml) at 4°C.
Peaks at 95S and 115S.

For more information on the Sorvall RC-5B system, write to DuPont Company, Room 36324, Wilmington, DE 19898.

*U.S. Patent 3,998,383

With Sorvall Centrifuges the spin times are changing.

Sorvall® Centrifuges

at home in your lab

For 3500 years all fabricated glass was soft; then Corning originated the hard, borosilicate glass used in PYREX® products in our kitchens and our labs. This special edition beaker underlines the fact that all PYREX brand products come from Corning and only from Corning. Corning also originated VYCOR® 96% silica beakers, PYREX low actinic beakers, beakers with Teflon® lips, and beakers with handles.

PYREX® and VYCOR® are registered trademarks of Corning Glass Works. TEFLON® is a registered trademark of the E.I. du Pont de Nemours & Co. (Inc.)

Our friendly computers out of automating

take a lot of the snarls instruments.

HP desktop computers are easy to hook up, easy to program and easy to operate. In short, we made them friendly—and powerful—so you can automate your instruments in a hurry without working nearly as hard as you might have expected.

HP desktops offer many performance features usually associated with minis. For example, buffered I/O, direct memory access and a real-time clock. In addition, they allow you to do keyboard calculations and analysis while the computer is controlling multi-instrument systems.

Interfacing is a snap. You just plug in one of four standard interface cards, attach the cable to your instrument, sit down at the keyboard and start programming your application in a high-level language with powerful I/O commands. Since there's no compiler, editing is quick, easy and direct.

Our computers come fully integrated with keyboard, printer, display, data storage, operating system and pre-programmed I/O drivers in one compact unit, ready to go right to work on your application.

HP desktop computers are also versatile.

You can easily switch from one application to another. Change programs and variables in the middle of a run. Move the computer to a new location with ease.

If you want to automate your instruments, but don't savor the prospect of becoming a part-time computer technician and programmer, talk to us.

Call your local HP sales office or circle our reader service number for more information about our friendly, but very capable, desktop computers for interfacing.

Ask about our OEM contracts and volume discounts.

See-Through™ suspended cage systems **The most versatile small animal housing systems available.**

(So many options...you "build" it to your own specs.)

Basically, this system involves a mobile stainless steel rack with suspended polycarbonate cages. Two rack sizes are available: the large rack accommodates either 60 small cages, or 30 large cages, or combinations of both size cages. The new smaller rack size takes either 50 small cages, or 25 large cages, or combinations of both. This See-Through™ system is ideal for housing rats, mice, hamsters, and guinea pigs.

The many other options

Cage sizes: 10½" x 9½" x 8" deep or 19" x 10½" x 8" deep.

Cage bottoms: solid or stainless steel wire mesh.

Walkfloor mesh: 2 x 2 (for rats) or 3 x 3 (for mice).

Food hoppers: Four available (for rats, mice, and guinea pigs).

Watering systems: Bottle or automatic (many variations available).

Filtering systems: New disposable formed plenum polyester spun-bonded filter that provides at least 100% more filter area than flat sheet filters. Effective in reducing cross-contamination and in minimizing the stress of a high ammonia atmosphere. Also available: autoclavable filters.

3. Rack accommodates small or large cages or combinations of both.

4. One available automatic watering system shown; other automatic systems or bottle watering also available.

Other important features/benefits

Of fundamental importance regardless of how you "build" your See-Through system initially to meet your current needs, its flexibility assures easy modification to your *future* requirements. And in an era where change is inevitable and budgets tight, this kind of foresight can substantially reduce "future shock."

No separate cage lids! Each cage is suspended from the shelf above, and that shelf is *perforated*. Accordingly, the *perforated* shelf itself serves as the "lid" for the cage immediately below. No initial lid cost. No subsequent handling. No replacement.

Visibility. As the See-Through name implies and the photos demonstrate, animal observation is completely unimpaired.

Excreta trays. Easily removable.

New Product!

See-Through II: meets ILAR's new housing specifications (see "Guide for the Care and Use of Laboratory Animals"). 8" deep cage with 200 sq. in. floor area at dead bottom houses 5 rats. 6" deep cage with 75 sq. in. floor at dead bottom houses 5 mice.

R & D Expenditures in the United States

Recently published data (1) bear witness to the continuing erosion of support for science and technology in this country. The general trends of the data show two specific problems that deserve a high degree of attention by responsible authorities. These relate to (i) the total expenditure for research and development (R & D) in the nation as a whole and (ii) the expenditure for basic research in industry.

Although the debate regarding the appropriate level of R & D expenditure has continued over the years, with various factions advocating different economic indicators as a basis, no one has raised the issue that the level should perhaps depend upon equivalent activities in other developed nations with which we trade. Perhaps this is due to the continuing change in the value of U.S. currency with respect to that of other countries, as well as to the variation in direct and overhead costs per researcher, which makes such comparisons difficult.

Fig. 1. Scientists and engineers engaged in R & D per 10,000 population by country, 1965-75.

Fig. 2. Basic research expenditures by performer, 1960-76 (in constant 1972 dollars).

To overcome this confusion and to obtain a more meaningful comparison, I suggest we use the data on the total number of scientists and engineers engaged in R & D activities in the various countries (1, pp. 7 and 86). If we assume equivalent brainpower, dedication, and facilities, these data yield some interesting observations (Fig. 1). Perhaps the most striking comparison can be made between the United States and Japan, where the data show, respectively, 25 and 22 scientists and engineers per 10,000 of the general population for 1974. More recent data show the numbers to be 25 and 24, respectively, for 1975, with the number for Japan still rising. Since the population of Japan is about half that of the United States, it follows that, in absolute terms, the United States has twice as many people involved in R & D as does Japan, a preliminarily comforting thought.

Unfortunately, if we then look at the historical record of areas where the government portion of R & D expenditures has been used, we realize that, whereas the U.S. government spends approximately 64 percent of its R & D outlay on defense and space-related work, the Japanese government spends only 8 percent of its outlay (1, p. 9). These figures are approximate, but nevertheless they present a telling story about the magnitude of Japan's R & D effort. In terms of actual manpower in work not related to defense or space, Japan in 1975 had three scientists and engineers working in R & D for every four in the United States. While it is possible to cite a few past fallouts from space- and defense-related research in the United States, we should not overlook the fact that Japan has built a powerful R & D force aimed directly at commercial markets. The potential consequences of this strength in terms of overall economic returns for Japan, both now and in the immediate future, are apparent and need not be reemphasized.

The second problem relates to the level of basic research expenditures in industry. Here, the data (1, pp. 69 and 225) show a continuous drop since 1967 to the extent that, in 1976, the value of all basic research in industry, in constant dollars, remains approximately the same as that in 1960 (Fig. 2). The universities, fortunately, have fared much better, holding their level to approximately the same value as that in the 1967 peak year, or almost three times that in industry. The decline of basic research in industry has, unfortunately, come about through elimination of this type of work in many of

The Fluophot's unique illumination-centering device is a viewing screen that fits into the nosepiece like an objective.

**Nikon's new
Fluophot does you
a good turn:
one fluorescence
to another at a
twist of its turret.**

With one quick turn of the turret of the new Nikon Fluophot research fluorescence microscope you select any of four separate built-in modules for ultraviolet, violet, blue, or green excitation, each with its proper excitation filter, corresponding dichroic mirror, and correct barrier filter in position.

While the turret moves, a barrier filter is automatically positioned to keep stray ultraviolet from reaching your eyes. And a single control knob lets you switch instantly between reflected light and transmitted-light fluorescence.

Fast and convenient, but Nikon goes further. Seconds after you sit down at the Nikon Fluophot you have its powerful 200W mercury-arc illuminator focused and centered by its unique nosepiece-mounted centering tool.

The entire epi-fluorescence unit of the Nikon Fluophot is built into the horizontal arm of the microscope for

absolute rigidity. A new high-transmission trinocular head delivers bright images. An accessory 100W quartz-halogen illuminator provides simultaneous or separate transmitted illumination. There's a set of superb new Nikon CF objectives for any research requirement. And the Fluophot is designed to accept a wide range of Nikon photo-micrographic accessories.

Do yourself a good turn. See the new Nikon Fluophot. Nikon Inc., Instrument Division, Ehrenreich Photo-Optical Industries, Inc., 623 Stewart Ave., Garden City, N.Y. 11530; (516) 222-0200.

New short columns stand up to HPLC

New short columns with economical disposable cartridges and quick disconnect fittings for fast replacement can save you a bundle of money if you do many routine LC separations.

In any routine analysis when a few thousand plates will suffice, you should switch to our short column technique in the interests of efficiency and economy.

New short columns are packed with 10 micrometer sorbants of the same quality and type used in the longer columns. The packed 4.6 mm x 10 cm column is disposable. Cartridges are connected to the LC system through a holder with quick disconnect low dead volume fittings. When the column is worn out, you simply throw it away. Save the holder and put in a new cartridge. Costs are about half that of standard 25 cm HPLC columns.

Nine different sorbants covering reverse phase, adsorption, polar bonded and ion exchange modes of LC are available. Sorbants are of the same materials used in standard HPLC columns.

More information.

We invite your inquiry on these new Brownlee columns. For a complete description write for our new four page brochure. Please address Rheodyne, Inc., 2809 Tenth Street, Berkeley, CA 94710. Phone (415) 548-5374.

the small and medium-sized companies, where the absence of such skills now makes their interaction with universities more difficult. This may, therefore, exclude these companies from participation in joint university-industry research programs of the type that the National Science Foundation is attempting to promote (2). Although this trend is the direct result of judgments made by the managements of these industries (and perhaps reflects the view that more short-term than long-term investment is desirable at this time), the long-term impact of this change in policy is extremely detrimental to the country as a whole. The companies that will be able to participate in this program are those which need this assistance least, as they already have a reasonable internal component of basic research. Most of these companies will, in fact, shy away from the program because of its extra administrative burden. The result can be a generally unfavorable response to the program.

To counteract this unfortunate trend, it may be necessary for Congress to provide certain tax incentives to industry to promote basic research. With a basic research core reestablished in many of the companies that have now abandoned it, the hope for a more successful promotion of joint university-industry research programs through the National Science Foundation grants may come closer to reality.

Velikovskianism

One of Anthony F. Aveni's concluding statements in his review (20 Jan., p. 288) of *Scientists Confront Velikovsky* (1), a collection of papers from a 1974 AAAS symposium, is: "As far as Velikovskianism is concerned it is dead and buried. The final nail has been driven." Nothing could be further from the truth.

In its November 1977 issue, which appeared about the same time as *Scientists Confront Velikovsky*, *KRONOS*, an interdisciplinary journal devoted to the investigation of Velikovsky's theories,

presented a very effective answer to the criticism in the book. That issue, which has been published as a book under the title *Velikovsky and Establishment Science* (KRONOS Press, Glassboro State College, Glassboro, N.J.; vi, 144 pp., illus., \$9.95; also available in paperback version at \$5), contains Velikovsky's AAAS address "My challenge to conventional views in science," rebuttals by Velikovsky to the arguments of four of his critics at the AAAS meeting, a special answer by Velikovsky to ten points raised by Carl Sagan, and rebuttals by six Velikovsky supporters to criticism contained in *Scientists Confront Velikovsky*. These articles show that the present-day critics of Velikovsky have not learned anything from the mistakes of those of the 1950 era, some of whom were shown not to have read the work they were criticizing.

I was not fortunate enough to attend the AAAS Velikovsky symposium. However, I did purchase the five cassette tapes prepared by the AAAS covering the morning and evening sessions of the symposium. After listening to them numerous times, including Velikovsky's rebuttals from the floor, I concluded that Velikovsky had the better of all arguments.

It is my personal opinion that anyone considering criticizing Velikovsky's work would do well first to read all his books carefully. Then he or she should read all the pro-Velikovsky writings such as those contained in *Pensée*, *KRONOS*, and *SIS Review*. I think it is probable that, having done so, a critic who is honest with himself or herself would be changed from anti-Velikovsky to pro-Velikovsky.

The Bausch & Lomb SPECTRONIC® 21 Spectrophotometer

In the next century, testing will require the highest degree of simplicity and reliability. You will need a spectrophotometer that delivers a continuous wavelength of 200nm to 1000nm for uninterrupted testing. One that has an automatic 0%T feature to eliminate readjustment between tests. And one that has impeccable quality to assure fast output and accurate results.

But you don't have to wait that long. The Bausch & Lomb SPECTRONIC 21 Spectrophotometer lives up to these tests now. What's more, it is available in four different models, visible and UV-visible in meter and digital.

It is the greatest spectrophotometer value available today. And because it's from Bausch & Lomb, it will live up to the test of tomorrow.

Call your nearest Bausch & Lomb representative, or one of our dealers, VWR or Fisher Scientific. Or call us at (716) 385-1000, ext. 325.

Up to the test of the 21st century

CONSTANT °C. GUARANTEED AT TWELVE LOCATIONS

**and one free
teddy bear**

When we say this Model 625 PRECISION Oven is uniform at $100^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ we mean throughout the entire cavity!

Uniformity is confused in some specifications with thermostat sensitivity or a one-spot temperature check.

Not so with Precision. We employ twelve iron/constantan thermocouples suspended throughout the chamber. We test in accordance with ASTM E145. When we say $\pm 0.9^{\circ}\text{C}$ at 200°C , we mean the exact temperature difference in the air currents through the entire working chamber.

If that sounds fanatic, it's because we believe that precision is what makes a room a lab. To be scientific is to be precise.

Measure the holes. Even the diffuser holes in our ovens are an exclusive arrangement of graduated orifices to promote even, horizontal delivery based on pressure differentials within the duct system.

Free lab bear. The teddy bear is to remind you that buying lab appliances is not much different than buying home appliances—it doesn't make much sense to stint on something you want to operate reliably for many years.

The teddy may also comfort you until you get your PRECISION oven with guaranteed °C. For our new catalog, write GCA/Precision Scientific Group, 3737 West Cortland Street, Chicago, Illinois 60647.

CONSTANT °C TAKES
PRECISION™

Circle No. 187 on Readers' Service Card

Precision uses a black heat, nichrome resistance wire. The heating element is never more than 50°C above operating temperature. In more than 25 years' service not one has been replaced due to heater burnout. Check our catalog to see dozens of other features like this that make Precision ovens your most scientific purchase in constant °C appliances.

Every year, U.S. motorists wear off nearly a billion kilograms of tire tread. Where does it all go? Do the emissions contribute to air pollution?

Scientists here at the General Motors Research Laboratories were more than just curious. So, in 1972, they started a program to determine: The amount of tread that comes off as gas and as solid matter. What gases are involved. And what happens to the solids.

For this research, they had to design and build a special facility with an air-tight chamber. The facility allowed them to duplicate both front and rear tire wear under a wide range of driving conditions, and to collect all the wear products for analysis.

What did the study reveal? On the average, large (nonairborne) particles accounted for about 94% of total tread wear. Airborne particles, less than 5%. And gases, mostly hydrocarbon, a negligible 1%.

The particle results correlated with measurements of soil and air samplings taken along the San Gabriel River Freeway in Norwalk, California. (It was not feasible to measure gaseous hydrocarbons from tires at the road site.)

As for the disappearing act, outdoor measurements shed light on that too. The California study showed that the bulk of the tire debris lies within a five-meter strip next to the pavement edge.

All of which thus far suggests that tires play only a minor role in the air pollution picture.

Automotive emissions research . . . from tailpipes to tires . . . the continuing quest for better ways to understand and control the factors affecting our environment.

If you have a Ph.D. in engineering, physical, mathematical or biomedical sciences, perhaps you can make important contributions at General Motors Research Laboratories. We invite you to check a number of current openings on our research staff by writing GMR Personnel, Dept. 115. An Equal Opportunity Employer.

Tires: the great American disappearing act.

Scientists and World Needs

Scientists have a long tradition of international cooperation. Initially their interaction was based on admiration for scientific contributions. With time the intensity and scope of interaction have increased. Air travel and the telephone have multiplied the opportunities for meaningful contacts, mutual respect, and friendships. In consequence scientists have tended to be unusually internationally minded.

Until the last decade cooperation among scientists was focused strongly on fostering science. But now substantial emphasis is being directed toward important world problems. In seeking to be helpful in meeting human needs elsewhere, scientists have discovered that the practical problems are complex and difficult; quick solutions are enormously costly. The world's scientists possess a substantial fraction of relevant intellectual capacity; they have very little control of funds.

Under such circumstances, it would be easy to become frustrated. But this has not happened; rather the tempo of organized efforts has increased, stimulated in part by the forthcoming United Nations Conference on Science and Technology for Development. But activities by scientists will go on long after the meeting at Vienna in August 1979.

An important focus of the continuing efforts will be the International Scientific Unions. One example of activities involves the International Union of Pure and Applied Chemistry (IUPAC). Its activities are carried out by 1500 experts from 43 member countries who cover the spectrum of chemistry-related sciences and technologies. For most of its 59 years of existence the Union devoted its efforts to the regulation of atomic weights, chemical nomenclature and symbolization, analytical procedures, and standard methods of assay.

But IUPAC has recognized that though such activities are useful they are not enough, and it has created a mechanism designed to aid in identifying and solving problems of chemistry having direct impact on human needs. The effort bears the title Chemical Research Applied to World Needs (CHEMRAWN). IUPAC's initial enterprise under CHEMRAWN is a first World Conference on Future Sources of Organic Raw Materials. This major conference will discuss alternatives to petroleum as future sources of chemicals and chemical feedstocks. The conference, to be held in Toronto from 10 through 13 July 1978, will be attended by world leaders from government, industry, and academia. They will seek to define those factors that will determine the sources of organic raw materials at the end of this century.

Another example of effort by the scientific unions is an activity spearheaded by the umbrella organization for all of them—the International Council of Scientific Unions (ICSU). Through ICSU initiative, a number of nongovernmental organizations including those of engineers and social scientists will host a symposium in Singapore during late January 1979 that will involve participants from many countries. Objectives of the meeting include identification of substantive inputs into the U.N. Conference on Science and Technology for Development. Of more lasting consequence is exploration of institutional and other innovations which would enlarge the opportunities for scientists and engineers to participate in future years in the improvement of the human condition. One of the important objectives of the symposium is to illuminate the basic conditions necessary for the assimilation of science and technology into developing countries in a manner which significantly contributes to the development process. The symposium will explore such questions as "How can a systematic approach be made country by country to selection of technology relevant to it?" Such an approach is required because the various nations differ greatly in educational levels, technological know-how, internal markets, natural resources, financial strengths, managerial talents, and political climates.

Scientists cannot do everything, but if they select limited and doable objectives, they can make a meaningful difference.—PHILIP H. ABELSON

LOOK INTO THE LEADER IN TEMPERATURE CONTROLLED BATHS

NESLAB

For the finest in temperature control systems, look into the company that pioneered the EXACAL BATH CIRCULATORS. With a temperature range from -100°C to $+300^{\circ}\text{C}$ NESLAB products represent the highest quality in IMMERSION COOLERS, RECIRCULATING EXCHANGERS and BATH CIRCULATORS. Research Microscope

The Optiphot is available with accessories for phase contrast, dual observation, incident-light fluorescence and darkfield, and Nomarski differential interference contrast (transmitted and reflected) microscopy. The CF objectives and eyepieces employ extra-low dispersion glass and integrated multilayer coatings and they are free of chromatic aberration across the entire field of view. The Siedentopf body tubes adjust to assure constant length and they are inclined 30 degrees from the horizontal for comfort. The nosepiece accommodates five objectives. The Koehler illumination system covers all magnification ranges without change. Nikon. Circle 707.

Liquid Chromatography Column

The Partisil-5 is a reversed-phase accessory for high-performance liquid chromatography. It is fully silanized; octadecylsilane (C_{18}) groups are bonded (Si-O-Si) to a silica gel matrix in which particles vary in size by ± 0.5 micrometer. The column is guaranteed efficient at 45,000 plates per meter. It is available in analytical form at 4.6 millimeters inside diameter by 250 millimeters long and may be equipped with any of several end fittings for use with any liquid chromatograph. Whatman. Circle 708.

Cytometry System

The Cytofluorograf System 50 offers analysis and sorting of cells. It contains two lasers, four detectors, and 12 distinct modes of measurement. There are two bidimensional regions for selection of

Newly offered instrumentation, apparatus, and laboratory materials of interest to researchers in all disciplines in academic, industrial, and government organizations are featured in this space. Emphasis is given to purpose, chief characteristics, and availability of products and materials. Endorsement by *Science* or AAAS is not implied. Additional information may be obtained from the manufacturers or suppliers named by circling the appropriate number on the Readers' Service Card (on pages 1326A and 1422G) and placing it in the mailbox. Postage is free.

—RICHARD G. SOMMER

subpopulations for sorting, differential counting, and frequency distribution. The helium-neon laser measures scatter and an argon laser measures fluorescence. The detectors measure pulse height, pulse area, and pulse width. Correlation of these measurements yields morphologic information from the output of the four detectors. Ortho Instruments. Circle 709.

Fraction Collector

The Fractomette Alpha 200 offers push-button selection of modes of collection including time, drop, or volume. Options include stainless steel trays, electrolyte bulb, connecting leads, and mounting hardware. The compact design accommodates up to 200 tubes per rack and the design permits easy removal and replacement of entire racks. The collector is operated by a single motor and the entire device is compact enough to be operated in a commercial refrigerator if desired. Buchler Instruments. Circle 710.

Laboratory Work Stations

The Hydrovoid atmosphere control system provides a dry or special inert atmosphere and the Microvoid dust hood removes airborne contaminants. The systems are modular and may be connected in series to control the atmosphere at specific sites in the laboratory. Systems may be designed to include clean chambers, storage cabinets, and accessories such as filters, dry box gloves and sleeves, and entry and scope ports. Air Control. Circle 711.

Serum Iron Analyzer

The FerroChem model 3050 measures iron in serum and total iron-binding capacity. Results for each determination are displayed in 60 seconds. In the analysis of total iron-binding capacity, a 50- to

100-microliter sample requires a 5-minute ion-exchange process for measurement. Serum iron determination requires only 10 to 100 microliters of serum. Calibration is simple with an inorganic iron standard or commercially available reference sera and a blank control. Preparative chemistry is minimized or eliminated and the electrochemical method employed is very sensitive and precise. Environmental Sciences Associates. Circle 712.

Tissue Sectioner

The Vibratome will section most fresh animal or plant tissue without freezing or embedding. A vibrating blade distributes cutting force evenly laterally. The operator controls blade vibration, feed rate, the specimen vise, cutting angle, and thickness of section. The device will slice as thin as 10 micrometers. The blade angle is adjustable from 1 to 50 degrees. A fluid bath lubricates the blade, prevents build up of heat, and allows easy retrieval of cut sections. Blades are disposable and easy to change. Operator selects the type of fluid for the bath. Oxford Laboratories. Circle 713.

Pharmacia Dual Path Monitor UV-2

has a unique flow cell with two optical path-lengths for new versatility in UV-monitoring.

- Monitor absorbance quantitatively up to 20 OD units full scale with a sensitivity of 0.005 OD units full scale at the same time, in the same run.
- Monitor at 254 nm and/or 280 nm with two completely independent measuring systems.

The Dual Path Monitor UV-2 has all the other features you expect of a high performance monitor: stability, cold room operation convenience and compact design. For less-demanding applications you can choose the Pharmacia Single Path Monitor UV-1 with a choice of 3 mm or 10 mm flow cell and operation at 254 nm or 280 nm.

Find out more about the practical advantages of column monitoring with the UV-2 and UV-1 Monitors. Ask about the Pharmacia Recorders too.

A new approach in tissue culture

PETRIPERM
a novel culture dish
with gas permeable
membrane as cellular
support

Additional advantages of the PETRIPERM membrane are:

- UV permeable 200 nm
- Suitable for high power light and fluorescence microscopy
- The membrane can be cut for cell cloning, electron microscopy, staining and documentation
- Chemically resistant to acids, bases and organic solvents

PETRIPERM is available either with a hydrophilic surface for optimal attachment, or with a hydrophobic surface for easy detachment of adherent cells.

In the intact animal, the pH, and the partial pressure of both oxygen and CO₂ of the cell environment are under total biochemical and physiological control. This state is not even approximated by available techniques of monolayer cell culture in conventional tissue culture ware. Continuously changing gradients of these parameters in the micro-environment of cultured cells will obscure the biological significance of culture dependent phenomena. PETRIPERM is the prerequisite for the precise control of pO₂, pCO₂ and pH in the cellular environment as gases reach the cultured cells directly through the highly gas permeable 25 µm thick membrane.

IgGSORB

The New IgG Adsorbing Agent

- 10 minute incubation
- Separates antibody-antigen complex from free antigen (RIA)
- eliminates double antibody
- highly specific for IgG
- lyophilized
- long term storage life

IgGSorb, New England Enzyme Center's new IgG Adsorbing Agent simplifies the separation of antibody complexed antigen from free antigen — eliminates double antibody procedures and reduces incubation time from several hours to minutes. IgGSorb is Protein A, fixed to the wall of inactivated, lyophilized staphylococcus aureus cells. It specifically binds the FC portion of IgG antibody, separating it from the solution and eliminating long incubations where double antibody processes are usually required.

IgGSorb is particularly useful in performing RIA separation of antibody complexes from uncomplexed antigen. IgGSorb binds rapidly in about ten minutes and separates easily by centrifugation or filtration. With a long storage life, IgGSorb has almost universal use, and in some cases can replace charcoal and other cumbersome RIA separation methods.

NEW for immunodiagnostic research
applications in virology, microbiology, parasitology, and immunology:

The
FIAX™

Front Surface Fluorometer

- **Sensitive.** Ideal for immunodiagnostic work.
- **Surface technique.** Allows the use of solid phase separation with FIAX™/StiQ™ Samplers.
- **Innovative design.** Patented design features provide stability, minimize photobleaching, and give high reproducibility.

Here are recent papers on the application of FIAX™/StiQ™ procedures:

R. Hart, A. Krezlewicz and D. Madden, "Use of a New Fluorescent Immunoassay System for Detection of Cytomegalovirus and Herpes Antibodies" (Paper delivered at the AAI Meeting, Atlanta, GA, June 1978).

D. D'Arcangelis and R. Deibel, "Experience with a Quantitative Assay of Rubella Antibody by a Single-Serum-Dilution Indirect Immunofluorescence (IF) Test" (Paper delivered at the ASM Meeting, Las Vegas, NV, May 1978).

P. Stiffler and L. Yang, "Comparison of FIAX™ system with Immunofluorescent Antibody (IFA) Technique for Detection of Anti-Nuclear Antibodies in Human Serum" (Paper delivered at the ASM Meeting, Las Vegas, NV, May 1978).

Immediate delivery!

Diet Control

At Bio-Serv we don't simply stock and ship test diets. Our dietary technicians produce diets that are specifically altered to conform to your individual research needs. Liquid diets. Pelletized or meal diets. Gel-Agar (semi-solid and ideal for carcinogen basal diet). Even hazardous and experimental drug containing diets. Formulated exactly to your specifications. Nothing more, nothing less.

Doesn't your research deserve this kind of attention? Send for our free catalog today and remember to compare prices before you buy!

Unitron's lab specialist.

Repeat orders for our series MKK lab microscopes are the best proof of satisfaction.

Unitron laboratory microscopes are available in comfortably inclined monocular, binocular, or trinocular models.

For fatigue-free operation, mechanical stage controls, as well as coarse and fine focus, are located conveniently. Body tubes can be rotated 360° for conventional or reverse position viewing.

Unless you have special requirements, there aren't any extra accessories to worry about. Unitron lab microscopes come fully equipped with built-in variable-intensity illuminators. And a full set of parfocal coated achromatic objectives. The 40x and 100x are spring-loaded to prevent accidental damage. The eyepieces are 10x widefield.

Ask for information about Unitron's lab specialist.

The Life of William Carmichael M'Intosh,

**ORION introduces
a new pH electrode
that won't get thirsty!**

How about a combination pH electrode that's more convenient to use because you don't have to fill it—that you don't have to worry about breaking—a rugged electrode that will cost you less than you're now paying.

This electrode never needs to be filled with KCl—it comes with a lifetime charge of gelled electrolyte.

ORION's model 91-05 electrode just won't break in normal laboratory use—it has a tough epoxy outer body that protects the glass sensing element from damage.

You'll get the stable, drift-free

readings you'd expect from the more expensive all-glass combination pH electrodes—but at a \$36 each list price. (If your facility buys electrodes in quantity, the list price drops to \$30.60 each, in cases of 24 electrodes.)

The model 91-05 combination pH electrode comes with a 30-inch long cable terminated with a standard U.S. connector that fits ORION, Corning, and Beckman pH meters. It's available off-the-shelf from most leading laboratory supply distributors.

ORION RESEARCH
380 Putnam Ave., Cambridge, MA 02139 (800) 225-1480

The best pipette is only as good as its tip

UNRELIABLE TIP

If your tip looks like this, you'd better question your sampling results. Flash in the tip's orifice retains fluid, inhibits proper liquid flow, and increases carry-over levels from sample to sample.

RELIABLE TIP

A clean orifice with no flash to trap fluid or obstruct proper flow – all tips should look like this. But only Rainin tips do. Our unique molding process maintains the non-wettable properties of polypropylene and provides tip-to-tip consistency.

Accuracy. It starts when the tip touches the sample. Do you dare put one of your disposable tips under a microscope and see what may be influencing your results?

After you've examined your tip under the microscope, examine ours. Write for free samples or phone toll free 1-800-225-4590. Ask for our catalog with tip selection guide.

*Unretouched photographs of tips selected randomly and photographed under identical conditions. (Zeiss Stereomicroscope, Polaroid 665 film, 32X, 25 sec. exp.)

Replacement tips available for Gilson Pipetman®, Eppendorf®, Oxford®, MLA®, Finn®, and Sherwood®.
