

## AAAS-Newcomb Cleveland Prize

Reports and Articles that include original research data, theories, or syntheses and are fundamental contributions to basic knowledge or technical achievements of far-reaching consequence are eligible for consideration for the prize. The paper must be a first-time publication of the author's own work. Reference to pertinent earlier work by the author may be included to give perspective.

The award will be presented at a session of the annual meeting. In cases of multiple authorship, the prize will be divided equally between or among the authors.

*Deadline for nominations: postmarked 15 August 1979*

# Nomination Form

AUTHOR: \_\_\_\_\_

TITLE: \_\_\_\_\_

DATE PUBLISHED: \_\_\_\_\_

JUSTIFICATION: \_\_\_\_\_

(Continue on additional sheet, if necessary)  
Machine reproduction of this form may be used.

# Articles for Science

Articles for *Science* may range in length from 2000 to 5000 words. They may be illustrated. They should be written in language suitable for a broad scientific audience, half of whom have Ph.D. degrees.

Articles of general interest or of interdisciplinary interest, or articles that will enable readers outside the author's field to keep abreast of new work in the field are especially appropriate.

Such an article may be a description of a current research problem or of a technique of wide significance, a review of new developments in one field, a study in the history, logic, or philosophy of science, or a discussion of the problems that science raises for other forms of human endeavor, including problems raised by the interaction of science and public affairs and problems in the administration of research, public understanding of science, and science education.

## Submitting a Manuscript

Manuscripts submitted to *Science* for consideration for publication can be handled expeditiously if they are prepared in the form described in these instructions.

Submit an original and two duplicates of each manuscript. With the manuscript send a letter of transmittal giving (i) the name(s) of the author(s); (ii) the title of the paper and a one-sentence statement of its main point; (iii) four to eight words for indexing; (iv) the name, address, and field of interest of four to six persons outside your institution who you think are qualified to act as referees for your paper; (v) the field(s) of interest of readers who you anticipate will wish to read your paper.

*Editorial policies.* All papers submitted are considered for publication.

## Preparing a Manuscript

Use a good bond paper, not "erasable" or thin paper, for the first copy. Submit two additional copies of all text

### Writing

In writing your article, give primary consideration to the reader and follow the basic rules of narrative prose: speed, economy of words, and clarity. Give the reader a clear picture of the object, event, or idea you have in your mind. Remember that the reader will not be able to make a clear picture from your words if you overwhelm him with detail, and that he will not be able to fill in details if you give him a mere sketch.

*Organization.* Organize your material carefully, putting a statement of the problem first, supporting details and arguments second. Make sure that the significance of your paper will be apparent to readers outside your field, even if you think you are explaining too much to your colleagues. Present each step in terms of the purpose it serves in supporting your finding or solving the problem. Avoid a mere chronological account of

The author's membership or lack of membership in the AAAS is not a factor in selection. Papers are accepted with the understanding that they have not been published, submitted, or accepted for publication elsewhere. Authors will usually be notified of acceptance, rejection, or need for revision in 6 to 10 weeks.

*Copyright.* Authors of accepted papers will be asked for a formal assignment of their copyrights to AAAS. The assignment form reserves to authors the right to reuse their material, the right to participate in decisions concerning permissions sought by third parties for non-educational purposes, and the right to obtain a reassignment of the copyright if they wish to do so.

*Reviews.* Almost all articles, whether solicited or not, are sent to two or more outside referees for evaluation of their

steps, for the purpose of the steps may not be clear to the reader until he finishes reading the paper.

*Language.* Avoid specialized laboratory jargon, pet phrases, and abbreviations, but use technical terms as necessary, defining those likely to be known only in your field. Readers will skip a paper they do not understand. They should not be expected to consult a technical dictionary. Be especially alert when you are tempted to use a phrase consisting of three or more nouns and adjectives in succession, for specialized knowledge of your field may be required for correct interpretation, and few of these phrases are listed even in technical dictionaries.

Use metric units of measure in text and illustrative matter.

Choose the active voice more often than you choose the passive, for the passive voice usually requires more words; it often obscures the agent of action and reduces the speed of narrative. Use first person, not third; do not use first person plural when singular is appropriate. Use a good general style manual, not a specialty one. *A Manual of Style* (University of Chicago), the *Style Manual* (American Institute of Physics), and the *Council of Biology Editors Style Manual* (American Institute of Biological Sciences), among others, are appropriate.

significance and soundness. Forms showing some of the criteria reviewers are expected to consider are available on request.

*Editing.* Papers are edited to improve the effectiveness of communication between author and readers. The most important goal is to eliminate ambiguities. In addition, improvement of sentence structure often permits readers to absorb salient ideas quickly. When extensive editing seems desirable, authors will be consulted before type is set.

*Proofs.* Authors receive one set of galley proofs. Keep alterations to a minimum; and mark them only on the galley, not on the manuscript. Extensive alterations may delay publication.

*Reprints.* One hundred reprints are supplied gratis for each article published. An order blank for additional reprints accompanies proofs.

material and three glossy prints of all illustrations. Double-space title, subtitle, author note, summary, text, references (including the lines of a single reference), figure legends, and tables (including ti-

tles, column headings, body, and footnotes). *Do not use single spacing anywhere.* Put the name of the first author and the page number in the upper right-hand corner of every page.

## Title, Subtitle, and Author Note

Place title, subtitle, and author note on page 1.

**Title.** Write a title of one or two lines of up to 28 characters and spaces per line. Begin the title with a word useful in indexing and information retrieval (not "Effect" or "New" or "Observations on").

**Subtitle.** Provide a subtitle consisting of a complete sentence in two lines with a character count between 95 and 105 for the sentence (spaces between words count as one character each). Do not break words at the ends of lines.

**Author note.** Write a brief author note, giving your position and address. If you have changed affiliations since you did the work you are describing, include both old and new addresses.

**Acknowledgments.** Place all acknowledgments in a single note at the end of the references and notes.

## Summary

Provide on a separate sheet an objective summary of 50 to 100 words indicating the scope and main findings of the article.

## Text

Begin the text on page 3.

**Subheads.** Insert subheads to be set in bold-face type at appropriate places in the text, averaging about one subhead for each three manuscript pages. Keep subheads short—up to 35 characters and spaces. Type them flush with the left-hand margin, using triple space above and below. Use only one other rank of subhead: the indented italic subhead introducing a paragraph.

## References and Notes

Select references to alert readers to the most significant previously published material. Large numbers of citations are less useful to general readers than a short

list of well-chosen ones. Citation of earlier review articles will usually provide sufficient recognition of the older literature. References to relevant controversial issues should be included.

Begin the "References and Notes" on a new sheet. Number all references to the literature and footnotes consecutively through the text, then number those in tables and figure legends. No reference should appear more than once in the list. Combine under one number any references that are not cited separately elsewhere in the article. Any reference or group of references may then be cited several times by number only. If references must be cited within notes, cite them by the appropriate number if they are cited anywhere else; otherwise place them within parentheses within the note. For standard abbreviations of journal names, use *Bibliographic Guide for Editors and Authors* (American Chemical Society, Washington, D.C., 1974). If the journal is not listed there, provide the full name. Use the following forms:

Journal: H. Smith, *Am. J. Physiol.* **98**, 279 (1931).  
Book: F. Datchile and R. Roy, *Modern Very High Pressure Techniques* (Butterworth, London, 1961), pp. 163-180.  
Chapter: F. Datchile and R. Roy, in *Reactivity of Solids*, J. H. de Boer, Ed. (Elsevier, Amsterdam, 1960), p. 502.

## Illustrations

Submit three glossy prints of each diagram, graph, map, or photograph. Cite all illustrations in the text and provide a brief legend, to be set in type, for each. Begin the legends on a new sheet; do not incorporate the legend in the figure itself. Plot in metric units. Place labels parallel to the axes, using capital and lower-case letters; put units of measurement in parentheses after the label—for example, "Length (cm)."

Plan figures for reduction to one of the following widths: 1 column (57 mm), 2 columns (118 mm), or 3 columns (179 mm). Maximum depth, including space for the legend, is 151 mm. Size the lettering in accord with the anticipated degree of reduction. The graph, not the lettering, should be the governing factor.

Photographs should have a glossy fin-

ish, with sharp contrast between black and white areas. Indicate magnification with a scale line on the photograph.

Do not submit more than one illustration (table or figure) for each 800 words unless you have planned carefully for grouping them. With such planning, many illustrations can be accommodated in one article. Consult the editorial office for assistance in planning.

**Cover pictures.** Particularly good photographs will be considered for use on the cover.

## Tables

Type each table on a separate sheet, number it with an arabic numeral, give it a title, and cite it in the text. Double-space throughout. Give each column a heading. Indicate units of measure (use metric units) in parentheses in the heading for each column. Do not change the unit of measure within a column. Do not use vertical rules. Do not use horizontal rules other than those in the heading and at the bottom. A column containing data which can be readily calculated from data given in other columns can usually be omitted.

**Size.** Plan your table. A one-column table may be up to 42 characters wide. Count characters by counting the widest entry in each table column (whether in the body or the heading); allow three characters for spaces between table columns. A two-column table may be 90 characters wide. A three-column table may be 135 characters wide.

## Equations and Formulas

Use quadruple spacing around all equations and formulas that are to be set off from the text. Most should be set off. Start them at the left margin. Use the solidus for simple fractions, adding the necessary parentheses. But if braces and brackets are required, use built-up fractions. Identify hand-written symbols in the margin, and give the meaning of all symbols and variables in the text immediately after the equation.

## New research findings . . .

### ON WALKING . . . nature's own amazing "*anti-age antibiotic*"!

Not running, not jogging, but *walking*  
is your most *efficient* form of exercise  
and the *only* one you can *safely*  
follow *all* the years of your life!

Today, after some 2000 years, modern medical researchers are demonstrating (somewhat to their surprise) that Hippocrates, "the father of medicine" was right . . . walking is man's best "*medicine*"!

Take one example. At a three-day conference on *Exercise in Aging—Its Role in Prevention of Physical Decline* (held October 27-29, 1977, at the National Institute of Health, Bethesda, Maryland) researchers from across the United States, Canada and Western Europe presented papers on this (until now) largely neglected area of research. As their papers were presented, these important points of agreement emerged:

(1) Walking is the most *efficient* form of exercise . . . and the only one you can safely follow all the years of your life.

(2) Exercise can enable your body to maintain a *vital reserve* which has a protective effect during stress.

(3) Exercised *bones* do not demineralize. As a result they are far less likely to break or lose their range of motion.

(4) Exercised *lungs* still exhibit the emphysema-like changes of age, but are far less diminished in their capacity compared to the lungs of sedentary people.

(5) Exercised *cardiovascular systems* show a similar maximum preservation of function.

(6) The benefits of exercise in preventing or correcting obesity are striking.

(7) Late-onset diabetes is almost entirely reversible by exercise if you are overweight.

(8) Daily exercise permits greater food intake and better blood circulation, thus improving each body cell's nourishment while preventing obesity.

(9) The physically impaired, particularly the arthritic, can perhaps benefit the most from exercise . . .

#### EDITORIAL BOARD

SIR HANS KREBS, M.D., F.R.C.P. (England), Nobel Laureate in Physiology and Medicine, Emeritus Professor of Biochemistry, Oxford University, Metabolic Research Laboratory, Nuffield Department of Clinical Medicine, Radcliffe Infirmary, Oxford, England.

RICHARD L. BOHANNON, M.D., F.A.C.P., Lieutenant-General, United States Air Force (Ret.); Medical Director, The Institute for Aerobics Research, Dallas, Texas.

JAMES F. TOOLE, M.D., F.A.C.P., The Walter C. Teagle Professor of Neurology, Bowman Gray School of Medicine, Wake Forest University, Winston-Salem, North Carolina.

LEONARD HAYFLICK, Ph.D., Senior Research Cell Biologist, Children's Hospital Medical Center, Bruce Lyon Memorial Research Laboratory, Oakland, California.

DEMETRIO SODI-PALLARES, M.D., Professor of Medicine, Chief of the Department of Electro-Vectorcardiography, Instituto Nacional de Cardiologia, Mexico, D.F.

ALBERT SZENT-GYORGYI, M.D., Ph.D., Nobel Laureate for Physiology and Medicine, Scientific Director, The National Foundation for Cancer Research, Woods Hole, Massachusetts.

JOHN K. LATTIMER, M.D., ScD., FACS, Professor and Chairman, Department of Urology, College of Physicians and Surgeons, Columbia University; Director, Squier Urological Clinic and Director, Urological Service, Presbyterian Hospital, New York City.

JOHN STIRLING MEYER, M.D., Professor, Department of Neurology, Baylor College of Medicine; Director, Baylor-Methodist Center for Cerebrovascular Disease, Texas Medical Center, Houston, Texas.

SOLOMON PALMER, Jr., M.D., Scripps Clinic and Research Foundation, La Jolla, California.

HANS SELYE, C.C., M.D., Ph.D., D.Sc., F.R.S. (C), President, International Institute of Stress, University of Montreal, Montreal, Quebec, Canada.

LINUS PAULING, Ph.D., Nobel Laureate in Chemistry and in Peace; Emeritus Professor of Chemistry, Stanford University, Stanford, California. Research Professor, Linus Pauling Institute of Science and Medicine, Menlo Park, California.

MARK D. ALTSCHULE, M.D., Visiting Professor of Medicine, Harvard Medical School; Lecturer in Medicine, Yale University; Staff Consultant, Boston City Hospital; Attending Physician, Boston Veterans Administration Hospital, Boston, Massachusetts.

ALTON OCHSNER, M.D., Senior Consultant in Surgery, Ochsner Clinic and Ochsner Foundation Hospital and Emeritus Professor of Surgery, Tulane University School of Medicine, New Orleans, Louisiana.

ROGER J. WILLIAMS, Ph.D., D.Sc., Professor of Chemistry, Co-founder and Consultant, Clayton Foundation Biochemical Institute, The University of Texas; Past President, The American Chemical Society, Austin, Texas.

# THE TRUTH THAT SHOCKS

too many executives too late!

**Only the fit survive.** Ignorance about how to take care of yourself can be the mistake that kills you in your 50's or 60's . . . like an ordinary man. But as an executive you are not an ordinary man. *Put your brains to use.* Discover what research scientists now know about how to take the best care you can of the only body you will ever have.

Remember this! The errors of our younger years, are drafts upon our older years, payable (with interest) some 30 years from date.

The so-called "diseases of old age" are essentially the diseases of 50 to 70 . . . "the dangerous years!"

Research scientists find that people who survive these "dangerous years" successfully (without acquiring some "chronic" disease such as cancer or heart trouble) are likely to live on for another healthy quarter of a century. They seem to have developed what might almost be called an immunity to these killers. Why? To find out, some careful studies have now been made of these longlived individuals.

May we suggest that you get the benefit of these new research studies for yourself? Do as so many thousands of executives do. Subscribe to Executive Health Report. The members of our Editorial Board are among the world's most distinguished authorities on preventive medicine. Their wise advice can help you not only live longer but enjoy those extra years! (Note their high qualifications as shown on opposite page.)

Executive Health Report is not sold on newsstands but only by private subscription at \$24 a year in the U.S.A. and its possessions, Canada and Mexico. Individual reports (back issues) \$2.00 per copy. All other countries \$26 by surface mail, \$30 by air mail. (Only International Money Order or check cashable on U.S. bank will be acceptable.)

Subscribe now under this unusual introductory offer:

(1) Your choice of any three of the reports listed below (\$2.00 each) FREE!

(2) If you are not *completely* satisfied with your first issue, your money will be *promptly* refunded.

Please study the reports listed here and circle your three choices:

New research findings On Walking . . . nature's own amazing "anti-age anti-biotic"!

Albert Szent Gyorgyi, M.D., Ph.D.: How new understandings about the biological function of ascorbic acid may profoundly affect our lives.

Linus Pauling, Ph.D.: For the best of health, how much vitamin C do you need? People who take the optimum amount of vitamin C may well have, at each age, only one quarter as much illness and chance of dying as those who do not take extra vitamin C.

George C. Griffith, M.D.: On those irregular heart beats (Arrhythmias). Some mean little or nothing, but others warn your heart is in trouble.

Raymond J. Shamberger, Ph.D.: On your risk of stomach cancer from untreated beef . . . and how the natural antioxidants, vitamins C and E and selenium, help protect you!

On The Syndrome Of Longevity. Key factors dependably present ("constants") in the way of life of men who have outlived other men born when they were by a generation!

Roger J. Williams, Ph.D., D.Sc.: On your startling biochemical individuality. Some amazing facts about your body you need to know if you want to understand yourself (and other people) better.

Linus Pauling, Ph.D.: On vitamin C and heart disease. Can vitamin C protect you, and how much should you take?

James F. Toole, M.D.: On Strokes and "Little Strokes" . . . their causes and what you should know about them to help protect yourself!

Sir Hans Krebs, M.D., F.R.C.S.: On the use and misuse of medication. The world-famous Nobel Laureate in Physiology and Medicine warns that too many patients are being made ill due to their own or their physicians carelessness because the new high-potency

drugs have side-effects that are almost unavoidable if not carefully monitored.

Alton Ochsner, M.D.: "On the Role of Vitamins C and E in Medicine." A world-famous surgeon tells you how he uses these two essential vitamins. John K. Lattimer, M.D., Sc.D.: On That Treacherous Gland . . . Your Prostate — as you approach 50.

John Yudkin, M.D.: On "This Sliming Business" . . . The truth about the prevention and cure of overweight!

Linus Pauling, Ph.D.: What About Vitamin E? Eminent investigators now suspect it may be one of the key factors to help resist disease and slow the aging process.

Mark D. Altschule, M.D.: Is It True What They Say About Cholesterol? Is it as dangerous as they claim?

Alton Ochsner, M.D.: On "The Chair Disease" . . . Why blood clots in your veins are a little-realized hazard.

Hans Selye, M.D.: On Stress Without Distress. Your mind can make or break you!

The B Vitamins . . . Part II. On Vitamin B<sub>6</sub> (Pyridoxine) "The Sleeping Giant of Nutrition."

Hardin B. Jones, Ph.D.: On The Problems Executives Must Anticipate With Marijuana Smokers. The Senior Scientist at the world-renowned Donner Laboratory of Medical Research, University of California, Berkeley, explains some dangerous, little-understood facts.

Linus Pauling, Ph.D.: On Vitamin C and Cancer. Recent studies show that vitamin C has a large life-extending effect for patients with advanced cancer and suggest a similar large effect for earlier stages of the disease.

Please use the coupon below under our special money-back guarantee.

**EXECUTIVE HEALTH, Pickfair Bldg., Rancho Santa Fe, CA 92067**

Gentlemen: Enclosed is my check for \$.....for a year's subscription to Executive Health to start with this month's issue. I have circled the three \$2.00 reports I am to receive free. It is understood that if I am not *completely* satisfied with my first issue, my money will be *promptly* refunded. In addition, I would appreciate your sending me a complete list of your 101 other reports because among them may be some from which I might greatly benefit and would otherwise miss.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

## COVER

Handmade mouse. This tricolored mouse was manufactured by genetic engineering techniques. The hexaparental chimeric animal was produced by aggregating three genetically marked embryos (white, yellow, and black) at the eight-cell stage. See page 56. ## FARQUHAR®

### MAKES THE UNIVERSE CLEAR

The Farquhar transparent, three color star globe is the most beautiful and dramatic method of bringing the universe inside of your world. It puts the stars at your command. You can adjust the star globe with over 1100 stars to correspond to any location and time on Earth. This great ball of knowledge offers a universe of features; all 88 constellations, names and distances in light years of brighter stars, milky way, ecliptic path of the sun, precessional path of the north and south celestial poles and much more, including our instruction manual. The universe comes in your choice of four sizes. Put one in your world today.

By the end of this century, when the world's demand for petroleum will exceed what it can produce, alternative fuels will have already begun phasing into the energy picture.

What will these new fuels be? Scientists here at the General Motors Research Laboratories long ago started exploring the possibilities. They've conducted engine studies with hydrogen, methane, ammonia, propane, acetylene, methanol, ethanol, and with liquid hydrocarbons from coal and oil shale.

Although the principal aim was to understand the combustion process, the overall system — from resources in the ground to power at the wheels — was also considered.

So what have we learned? Hydrogen, for example, behaves well enough in an engine. However, storage and control problems in a car severely limit its prospects.

Methanol, on the other hand, is more manageable. And we have modified production vehicles to run on this fuel. But methanol poses a serious starting difficulty below 5° C. Moreover, it would be costly.

Which brings us to gasoline and diesel fuel derived from oil shale. Environmental, social, and political factors may favor other alternatives. But our studies, based on energy efficiency and economics, indicate that these two derivatives have the greatest potential for being the automotive fuels of tomorrow.

Alternative fuel research. It's one of the many ways General Motors is preparing for the future.

*We currently have openings for Ph.D.s in engineering or the physical, mathematical, or biomedical sciences. If interested, please send your resume to: GMR Personnel, Dept. 1015. An Equal Opportunity Employer.*

# There's no fuel like the old fuel. But there are alternatives.

## Archiving Remotely Sensed Data

Since World War II an immense body of data has been obtained by remote sensing techniques. Although intended primarily for military intelligence, these data are an unprecedented resource for systematically studying how human action is changing the earth's environments in a time when these effects are increasing and are often irreversible. Processes of great interest to social and biological scientists and crucial for environmental policy cannot be effectively studied without the synoptic, ongoing records of change these data provide. They are, therefore, a precious and irreplaceable resource.

Deserts, for example, spread as a result of the complicated interplay of a number of processes, including various kinds of human activity. These processes and the ways in which human activity affects them are imperfectly understood. Their study requires repeated observations of such things as vegetation, soils, water, and human settlement and other activity for a large sample of localities. Monitoring for this purpose is now being implemented under the auspices of the United Nations, but its success will depend on the continued accumulation and preservation of the data base derived from remote sensing.

Many other modifications of the biosphere are proceeding rapidly also, with unknown long-term consequences. Long stable ecosystems are being affected in a variety of ways by progressive deforestation, the paving of significant areas of urban watersheds, and the industrialization of agriculture. The problems for which remotely sensed data will be invaluable are proliferating.

A serious threat to this data source arises from the rate at which remotely sensed data are themselves accumulating. The question is now arising of how or whether to preserve them. If thoughtfully drawn plans are not made and implemented soon, this data resource may be destroyed needlessly once its military use has been exhausted.

The problem has two aspects. First, some of the data are in the public domain. Their preservation for future use requires funding, which has not yet been provided, and careful plans for archiving. Second, the greater part of existing remotely sensed data are not in the public domain. The strategic importance of these classified records diminishes with time and will eventually reach the vanishing point. When they become declassified, these data will provide the bulk of the information on which this unparalleled opportunity to study environmental processes rests.

The record suggests that preservation of detailed strategic intelligence files is not often accomplished. Public appeals for their maintenance are awkward, since they are calls for the retention of something whose existence is not acknowledged.

We have arrived at a point, however, where the threats to national and even human existence are no longer largely military in nature. They are coming more and more from the increasing expenditure of energy for peaceful human purposes. What once were long-term processes subject to natural evolutionary constraints are now accelerating rapidly, and natural constraints have been, and continue increasingly to be, altered by human intervention. The vast body of remotely sensed data accumulated since World War II, in both the public and classified domains, is the most important new data source we have for monitoring these processes. Deliberate steps must be taken to ensure that potential benefits vital to our national interest are not wiped out by shortsighted destruction of this burgeoning record.

# TIAA-CREF Supplemental Retirement Annuities

## for tax-deferred annuity programs

Supplemental Retirement Annuities (SRA's) are new forms of TIAA and CREF contracts designed expressly for use by persons who want to set aside tax-deferred retirement funds over and above amounts being accumulated under their institution's basic retirement plan. They are available for employees of colleges, universities, private schools and certain other nonprofit educational organizations with tax-deferred annuity (salary-or-annuity option) programs. Through a properly drawn agreement with their institution, staff members may divert part of their compensation before taxes to the purchase of these new contracts.

**And SRA's are cashable at any time.** This means that if the money accumulated by salary reduction is needed before retirement, the SRA contracts can be surrendered for their cash value. Benefits, whether payable in cash or as income, are taxable as ordinary income when received.

For more information and answers to questions send for your copy of the booklet on Supplemental Retirement Annuities.
