

DMTRYK

New L-5B Ultracentrifuges with Dry Cycle, Automatic/Manual Operation, 0 to 40°C Capability, and 8 Billion Revolution Drive.

The new Beckman Model L-5B ultracentrifuges have improvements you'll readily appreciate. They will save you time in the Automatic mode—yet give you the flexibility of manual operation whenever you wish.

The Dry Cycle keeps moisture out of the rotor chamber. As a result, these new ultracentrifuges are always ready to run—the next hour or the next day. There is no time lost pumping the chamber dry.

0 to 40°C operation lets you run physiological samples at body temperature, increasingly important in a variety of research. And the Beckman L-5B drive—powerful and efficient with its DC electric design—

is so reliable we warrant it for 8×10^9 revolutions.

Four models are available: the L5-75B for 75,000 rpm, L5-65B for 65,000 rpm, L5-50B for 50,000 rpm, and the L5-50E economy model.

All with major improvements for your research needs.

Write for Brochure SB-540 to Beckman Instruments, Inc., Spinco Division, 1117 California Avenue, Palo Alto, CA 94304.

Our micromanipulator: It's positively Machiavellian.

Smooth, subtle, cunningly designed, this Leitz® instrument lets you manipulate with exactness, skill, delicacy.

You can operate on the most minute specimens at highest magnifications. Because it is a mechanical, rather than pneumatic or hydraulic device, the Leitz instrument is precise, trouble-free, and has no drift.

The unique lever and sliding bar design eliminate hand vibrations, settling of instrument tips and backlash. Movements of the guide lever are immediately reproduced as instrument movements.

The guide lever actuates fine movements in the x and y coordinates. The ratio of hand-to-instrument movement is continuously variable from 1:1/16 to 1:1/800.

Precise inclinations of instruments through 15 degrees may also be made. Moreover, gross adjustments of instrument position in all three coordinates may be made with the instrument holder itself. The micro-instruments can be interchanged quickly.

The micromanipulator reaches every point within the microscopical field of view instantly and precisely even under the highest magnification. The instrument is ruggedly built to eliminate vibrations so that you can perform exact and reliable micro-operations.

For information call (201) 767-1100 or write E. Leitz, Inc., Dept. JN5 Rockleigh, N.J. 07647.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

COVER

This well-preserved and complete hominid upper jaw exhibits some of the primitive morphology diagnostic of the newly described species, *Australopithecus afarensis*, Johanson, White and Coppens, 1978. The specimen (A.L. 200-1a) is from the site of Hadar in Ethiopia and is dated to about 3.2 million years. The right canine is fossilized partially out of its socket. See page 321. [Drawing by Luba Dmytryk, Laboratory of Physical Anthropology, Cleveland Museum of Natural History]

One of these six features should tempt you to try our TLC plates.

We can't show you (in this ad) the most important feature of all—reproducibility.

But that's the major reason behind all of the innovative features in our TLC plates.

The variables inherent in many TLC systems may be affecting your ability to obtain satisfactory reproducibility. We have recently developed some very unique ways to minimize or eliminate those problems.

1. Preadsorbent sample area is a unique spotting area that absorbs large volumes of crude, dilute, aqueous, or organic sample. The developing solvent system extracts and collects the material and then presents it uniformly to the silica gel, making prior clean-up, complex spotters, and special spotting skills unnecessary. Biological and similar crude materials may often be applied directly.

2. Multiple channel plates eliminate lateral diffusion and produce uni-

form, tight bands of separated material without the use of special spotters or streakers. Available with nineteen or four-channels — this unique plate is called LQD.

3. Hard-surface, super-fast silica gel plates—designated as Q6—are the hardest and fastest running pre-coated glass plates now available. Development time is half for almost all solvent systems in unsaturated tanks. Separation characteristics are equivalent to classical TLC.

4. Improved, brighter phosphors—These inorganic, high-contrast phosphors are the final result of several years of extensive development. All Kontes "F" formulations have these non-interfering 254 nm indicators.

5. Humidity-proof, protective template package* is another exclusive of Kontes TLC plates. Each plate is nested in a recessed spotting-template board and vacuum-sealed with ionomer film.† Inconsistencies in separation caused by humidity

changes are virtually eliminated—shelf life is extended indefinitely and preactivation is no longer necessary.

6. Broadest range of separation characteristics.

The Kontes TLC line offers a variety of plate sizes and formulations to accommodate all applications; from analytical to preparative, and quantitative to qualitative. The chart of comparative silica gel polarities (shown in reduced form) is included in Kontes/TLC literature as a guide.

There's a lot more to the Kontes line—but a demonstration is the best way to see for yourself. Contact your Kontes man. Or write for Bulletin TLC-100. Kontes, Spruce Street, Vineland, N.J. 08360. (609) 692-8500.

Amicon's "Tried 'n True Blue" Mätrex™ Gel

Amicon's "Step-Ahead Red" Mätrex™ Gel

**In group selective dye-ligand
affinity chromatography,
only Amicon lets you
be even more selective!**

Today, only Amicon gives you two choices in group selective dye-ligand, agarose-based affinity chromatography media. There's our Mätrex Gel Blue A, which has a high affinity for enzymes requiring pyridine nucleotides as cofactors.

And there's our Mätrex Gel Red A which has a preferentially high affinity for NADP requiring enzymes with lesser affinity for NAD requiring enzymes.

In addition, Amicon's new gels are useful for purification of serum albumin, interferon, kinases, CoA and folate requiring enzymes, and more.

Whichever you select, you'll find them both ready to use, with 10 to 100 times the protein capacity of nucleotide coupled agarose gels. And at a fraction of the cost.

Amicon, the only way to be even more selective in dye affinity chromatography.

amicon

For our new brochure, including specifications on both Amicon's "Tried 'n True Blue" and "Step-Ahead Red" Mätrex gels, fill out and return the coupon.

Why will more than half of purchasing LS instruments

all researchers select Beckman?

A decade of technical innovation dedicated to improving both the simplicity of instrument operation and data quality is the main reason.

For example, today's Beckman LS counters feature microprocessor control centers that blend true one-button operation for workhorse throughput, with on-line data reduction capability for a multiplicity of independent users.

Other design improvements, though less dramatic than full microprocessor control, have significantly advanced the state of the art. Automatic quench compensation. Quench monitoring by H[#] technique. Random coincidence monitoring for the detection of chemiluminescence. Counts per minute and two sigma error data handling procedures. True ambient counting capability. Single photon monitoring. And most recently, built-in instructional displays which eliminate operational guesswork and simplify user training. All these have been developed by Beckman in the last research-intensive ten-year period.

As you might expect, this genuine commitment to nuclear counting technology has also paid off for the user group with very high instrument reliability rates. While service, when necessary, has been fast, precise and readily available from a nationwide support network.

And thus, in the final analysis better final answers through a more reliable and innovative technology have made Beckman the leading manufacturer of liquid scintillation instruments.

Give yourself the chance to evaluate one of the three microprocessor-controlled instruments shown here or one of the other full capability instruments in the complete Beckman line.

You might be surprised to find that the very highest LS technology has a most reasonable cost.

For full information, contact your Beckman representative or Scientific Instruments Division, Beckman Instruments, Inc., P.O. Box C-19600, Irvine, CA 92713.

Innovation you can count on.

TIAA-CREF Supplemental Retirement Annuities

for tax-deferred annuity programs

Supplemental Retirement Annuities (SRA's) are new forms of TIAA and CREF contracts designed expressly for use by persons who want to set aside tax-deferred retirement funds over and above amounts being accumulated under their institution's basic retirement plan. They are available for employees of colleges, universities, private schools and certain other nonprofit educational organizations with tax-deferred annuity (salary-or-annuity option) programs. Through a properly drawn agreement with their institution, staff members may divert part of their compensation before taxes to the purchase of these new contracts.

And SRA's are cashable at any time. This means that if the money accumulated by salary reduction is needed before retirement, the SRA contracts can be surrendered for their cash value. Benefits, whether payable in cash or as income, are taxable as ordinary income when received.

For more information and answers to questions send for your copy of the booklet on Supplemental Retirement Annuities.

IMMUNOCHEMICALS FROM MILES?

YES, INNOVATIVE AND PROVEN PRODUCTS FOR RESEARCH AND CLINICAL LABORATORY USE.

Perhaps you think of Miles as a place to get the unusual, like antiserum to rat IgE or equine IgM.

Perhaps you know we offer a wide selection of human protein antisera encompassing newer products, such as antisera to myoglobin, ferritin and β -2 microglobulin, as well as established antisera to immunoglobulins, α -1 antitrypsin and other major serum proteins.

Of course, you may not associate us with immunochemicals at all... We think you should.

NOW AVAILABLE:

NUTRITION AND CANCER, An International Journal

Lon Crosby, PhD, Assistant Editor

Gio B. Gori, PhD, Editor

An international and multidisciplinary journal that covers the etiology, prevention, and therapy of cancer as related to diet and nutrition. Aspects include clinical and experimental research in nutrition, carcinogenesis, epidemiology, anthropology, toxicology/pharmacology, biochemistry/metabolism, food production, and prevention.

Quarterly \$48.00, U.S. \$56.00, foreign

Introducing:

COGNITIVE PROCESS INSTRUCTION

Research on Teaching Thinking Skills \$14.00

Jack Lochhead and John Clement, editors

A collection of 22 papers that explores the emerging field of Cognitive Processes. Based on a conference held at the University of Massachusetts, Amherst, in June 1978, this volume offers a number of different approaches to teaching thinking skills. The first section examines current research on Cognitive Process Instruction with contributions from Robert Karplus, Herbert and Dorothea Simon, and Jill Larkin, among others. The second section covers new approaches to teaching, starting out with general thinking skills, then focusing on the teaching of science and mathematics.

LC#78-22122, ca 375 pp. To be released January 1979.

PROBLEM SOLVING AND COMPREHENSION

A Short Course in Analytical Reasoning \$8.50

Arthur Whimbey and Jack Lochhead

A textbook for high school and college students, psychologists, and teachers demonstrating the art of thinking clearly. There are many example problems and solutions that show how the experts solve problems.

LC#78-22121, ca 250 pp. To be released in February, 1979.

SCIENCE AND THE CONGRESS

The Third Franklin Conference \$6.95

The Third Franklin Conference examined the interaction of science and technology with society and the role of the Congress in determining national needs, in regulating science and technology, and in keeping science and technology healthy. The conference was sponsored by The Franklin Institute and the Office of Technology Assessment.

LC#78-10115, 161 pp., October 1978.

New to our Clinical Series:

VIRAL HEPATITIS

Etiology, Epidemiology, Pathogenesis and Prevention \$49.50

G. Vyas, S. Cohen, and R. Schmid, editors

A case-bound book covering the proceedings of a major worldwide symposium held in March 1978 and sponsored by the University of California. The proceedings include 32 comprehensive reviews, 25 discussions, four panel discussions, and 12 workshop summaries, bringing up to date all research on viral hepatitis and creating plans for future cooperative studies.

LC#78-00882, 748 pp., October 1978.

Journals:

BULLETIN OF MAGNETIC RESONANCE

The Quarterly Review Journal of the International Society of Magnetic Resonance

J. Howard Bradbury, editor

Contains reviews on the theory and practice of nuclear magnetic resonance, electron paramagnetic resonance, and nuclear quadrupole resonance spectroscopy including applications in physics, chemistry, biology, and medicine.

Quarterly. To begin February 1979.

\$18.00, members; \$35.00, nonmembers; \$50.00, libraries.

Announcing two new, primary journals:

- NUTRITION IN HEALTH AND DISEASE
- NUTRITION AND AGING

To be published beginning in the Fall of 1979.

Interested persons are invited to write the editors c/o The Franklin Institute Press.

pH Electrode Quiz

QUESTION

The most common cause of pH electrode failure is:

- ☐ Other people break them.
- ☐ Other people let the reference dry out.
- ☐ Cosmic forces de-energize them.

ANSWER

Eventually all pH electrodes age; response becomes slow and span is short. Unfortunately, most electrodes are broken or let dry out before old age takes its toll.

PRIZE

Sensorex Combination pH Electrodes are prize-winners. They have:

- Epoxy Bodies with Recessed Bulb/Safeguard Tips to minimize breakage.
- Sealed, gel-filled references that never need refilling.
- Fast response over the full pH range.

Recombinant DNA Policy

Eliot Marshall's article (News and Comment, 22 Dec. 1978, p. 1265) on the changing relationship between environmentalists and scientists resulting from the federal debate on recombinant DNA research leaves the reader with a number of misconceptions.

The claim by certain scientists that those of us involved in the recombinant DNA debate were spinning out "procedural fluff" to keep ourselves busy is patent nonsense. Those involved in the debate at the Environmental Defense Fund (EDF) are interested in this issue because of the potential for harm and because its solution will be a precedent for future regulatory approaches to research and technology. Few would deny that there is a recognized need to regulate certain recombinant DNA activities, for example, those currently prohibited or sanctioned only under stringent controls. The task of delineating a workable system for regulating recombinant DNA research, contrary to Maxine Singer's claim, is little different from the other tasks we face.

EDF is not anti-science or anti-technology; nor are we secretly yearning for a return to a simpler age. We *are* interested in ensuring that the potential harmful effects of new technologies are identified and factored into policy decisions.

EDF wanted the National Institutes of Health (NIH) guidelines to ensure (i) public disclosure of information essential for oversight of the regulators and the regulated, (ii) participation on policy and oversight boards by individuals representing a range of responsible interests, and (iii) compliance with the guidelines by those carrying on recombinant DNA activities. At no time did EDF try to put itself on these committees or claim to solely represent the public. Rather, EDF has sought to ensure that a spectrum of individuals, for example, laboratory personnel and local public health officials, be given access to decision-makers. The scientific community, with a clearly vested interest in government regulation of recombinant DNA activities and established contacts within NIH and the Department of Health, Education, and Welfare (HEW), already has that access. Indeed, they had been the sole source of nongovernment input into the NIH decision-making process.

That our concerns were not adequately addressed in NIH's proposed guidelines of July 1978 is indicated by HEW Secretary Califano's convening of an ex-

traordinary panel to review the guidelines. This panel adopted many of the suggestions we raised.

Marshall's article creates the impression that the recombinant DNA debate has caused a substantial reduction in scientists' support for environmentalists' goals generally. However, in most cases criticism has come only from a small number of scientists who have been intimately involved in recombinant DNA research. Only the most vindictive of scientists have extrapolated from their disagreement with EDF over our recombinant DNA policy to the other issues, such as energy, preservation of wildlife, or control of toxic chemical pollution, that are the mainstays of our work. Scientists' support for this work has remained strong.

Marshall suggests that employees of groups like EDF proceed without oversight or responsibility to a larger organization. This is not the case. Organizational oversight of EDF involvement has been the same, if not more intense, for work on recombinant DNA as it has been for other controversial issues. As Marshall states, our Executive Committee has systematically reviewed and approved our position on recombinant DNA. It is true that our members are not involved in approving each position taken by EDF's staff. Instead, like the majority of membership organizations, EDF staff actions are judged by members on a regular, more general basis—when it comes time to renew membership and by letters. A recent poll conducted by Resources for the Future indicated that 61 percent of EDF's members felt it was important for environmental organizations to become involved in the recombinant DNA debate. According to the same poll, a majority of EDF's members, 52 percent, supported an immediate moratorium on DNA research pending public discussion. (I wonder whether our scientist friends would want us to accept that democratic input into our decision-making process.)

LESLIE DACH

*Environmental Defense Fund,
1525 18th Street, NW,
Washington, D.C. 20036*

The situation reported by Eliot Marshall reflects a far larger syndrome. The conservation-environmentalist movement owes its origins primarily to laymen, not to professional biologists; we have been slow in joining it, and that is our fault. Against this, however, must be balanced the fact that environmentalists lacking biological credentials and expertise have often zealously guarded their

Our compact MM-33 micromanipulator drives by hand or motorized 'joy stick'.

Ideal for working at magnifications up to 250X, the MM-33 provides coarse movements in 3 planes (XYZ) plus fine movement in the thrust axis. Excursions calibrated in millimeters with vernier readings to 0.1 mm; final drive calibrated to 10 microns. Ball-bearing raceways assure smooth, backlash-free operation. All controls aligned in same vertical plane permits use of several MM-33's side by side. Mounts on Flexbar or a variety of bases.

Also available in a motorized version (MM-33M), with 'Joy Stick' remote unit for vibration-free control of speed and direction. For literature, write: Brinkmann Instruments, Cantiague Rd., Westbury, N.Y. 11590.

The best pipette is only as good as its tip

UNRELIABLE TIP

If your tip looks like this, you'd better question your sampling results. Flash in the tip's orifice retains fluid, inhibits proper liquid flow, and increases carry-over levels from sample to sample.

RELIABLE TIP

A clean orifice with no flash to trap fluid or obstruct proper flow—all tips should look like this. But only Rainin tips do. Our unique molding process maintains the non-wettable properties of polypropylene and provides tip-to-tip consistency.

Accuracy. It starts when the tip touches the sample. Do you dare put one of your disposable tips under a microscope and see what may be influencing your results?

After you've examined your tip under the microscope, examine ours. Write for free samples or phone toll free 1-800-225-4590. Ask for our catalog with tip selection guide.

*Unretouched photographs of tips selected randomly and photographed under identical conditions. (Zeiss Stereomicroscope, Polaroid 665 film, 32X, 25 sec. exp.)

Replacement tips available for Gilson Pipetman®, Eppendorf®, Oxford®, MLA®, Finn®, and Sherwood®.

bailiwicks and studiously ignored—even deprecated—the biologists who have attempted to cooperate and further the cause.

Top-heavy with amateur naturalists and professional altruists, environmental organizations are apt to strongly resist input from biologists who tell them things they do not want to hear. For example, hard facts about demography—plant, animal, or human—are unpalatable compared to soft soap on organic gardening or returnable bottles.

It is exceedingly frustrating to be the sole, "token" biologist employed by a major conservation agency and bounce repeatedly off a solid wall of bureaucratic ignorance. When the ultimate decision-makers sport baccalaureates in business administration, economics, or "environmental affairs," perceptive, responsible positions on biological issues are most unlikely.

What we need to do is "biologize" the whole environmental movement. I see signs for hope in the young, aware professionals moving up in the ranks of biologists. But I fear they may be too few and reach positions of influence too late.

Fusion: Neutral Beam Technology

We strongly disagree with the statement by William D. Metz (Letters, 27 Oct. 1978, p. 370) that "it is generally acknowledged that the neutral beam technology used at Princeton (based on positive ions) cannot be extrapolated to a reactor-level plasma because the already modest efficiency plummets when the beam energy is raised." In fact, we believe it is likely that very high energy beams will not be needed for tokamak reactors. Early assessments (1) of neutral beam energy requirements indeed led to Metz's conclusion. However, these were typically made for circular, cross-section plasmas with neutral beams injected tangent to the inside edge of the plasma and with some combination of large plasma size, high density, or both. Conservative assumptions were also made about the required depth of penetration for the neutral beams. The resulting rules of thumb for injection requirements are not borne out in current conceptual designs for tokamak plasmas heated to ignition.

Because of increased understanding of tokamak plasmas, recent reassessments of beam energy requirements have led to a relaxation of some of the conservative assumptions. Smaller, elongated

plasmas with nearly perpendicular injection will provide for a large decrease in beam energy requirements. These energy requirements are further reduced by low plasma density ($\bar{n}$) during the injection heating phase ($\bar{n} < 10^{14}$ ions per cubic centimeter), outward shift of the magnetic axis as the plasma pressure increases, heating of the core of the plasma by alpha particles produced in fusion reactions, and the possibility of expanding the plasma radius during the approach to ignition.

These considerations have been incorporated into new assessments (2) of the required neutral beam energies for a non-circular tokamak reactor plasma with a minor radius of 1.25 meters. Beam energies in the range of 100 to 150 kiloelectron volts (keV) (deuterium) are calculated to provide adequate penetration for heating to ignition. Lowering the beam energy requires increasing power input to the plasma, but the higher neutralization efficiency of lower energy positive ion beams leads to roughly constant power supply requirements over the range of energies considered (100 to 150 keV deuterium). Direct conversion of the unneutralized positive ion beams has already been demonstrated (3) and, when perfected, will make neutral beams based on positive ion sources an efficient heating mechanism.

If the presently estimated sizes for conceptual reactor plasmas prove to be correct, positive ion deuterium beams below 200 keV can be efficiently used to heat tokamaks to ignition, at least through the first demonstration reactor. The Princeton Large Torus results have certainly helped increase our confidence both in neutral beam heating and in scaling to reactor plasmas.

Your washer may actually cause contamination !

And no wonder. The reason is quite simple. Most laboratory washers are adapted from the home dishwasher. The same nozzles are used for the pre-wash, detergent and rinse cycles. Cross contamination is unavoidable from one cycle to another.

The Heinicke anti-contaminant washer is especially designed for the exacting cleanliness demands of the laboratory. Each cycle—pre-wash, wash and rinse—has its own separate plumbing system. There's no way that residue from the

pre-wash, or detergent film from the wash cycle can be flushed back onto your glassware to ruin a future experiment.

And there's even more to a Heinicke. To insure the even distribution of water over and inside every test tube, beaker and pipette from both top and bottom, only the Heinicke anti-contaminant washer has the moving jet spray, separate sprays for each cycle move back and forth to insure that no surface is sheltered from the thorough cleaning process.

his way to you in 48 hours!**

You'll seldom need the Minute Man service, because Heinicke and Napco instruments are built to work. But if you do, just dial toll-free 800-327-9783.

Hitachi/Perkin-Elmer introduces H-300 the world's first Universal Electron Microscope (UEM)

Mouse glomerules at 700X, full frame; wider field of view, with full frame, obtainable at 250X.

Magnetic tape, Au coated @ 100,000X.

It's a TEM

4.5Å guaranteed
75 kV
250X-100,000X

It's a SEM

100Å guaranteed
20 kV
50X-100,000X

We call the H-300 a UEM because there's simply no conventional way to describe it. For the first time, a full-fledged TEM and a full-fledged SEM are packaged in a common console—without compromising performance in either mode.

The TEM mode, for example, includes a wide field, low mag image free of peripheral blur. This eliminates tedious montaging. You also get zoom over the entire magnifica-

tion range. An eucentric side-entry goniometer stage is optional.

As an SEM, the H-300 is just as versatile, easily handles bulk specimens. You can also add options like Mode Control with EDX interface, an energy dispersive X-ray spectrometer and Automatic Data Display. Plus Hitachi-patented Dual Magnification: using a single CRT, you can switch from a low mag view of your specimen to a high mag view of a specific field of interest.

In short, the H-300 gives you, in the space of one instrument, a total electron microscopy capability.

Best of all, you can get the UEM package for under \$70K. Or, buy it as a TEM for under \$50K, integrate the SEM later. For full details and/or a demonstration, call or write: Perkin-Elmer, Instrument Marketing Division, 411 Clyde Avenue, Mountain View, California 94043. Phone (415) 961-0461.

Risk: A Pragmatic De Minimis Approach

Society is becoming increasingly well informed and anxiety-prone about technology-associated risks, which leads to desire for their elimination. The logical and traditional approach is first to estimate the risk, a scientific task. Then comes the issue of risk acceptance, a most difficult step—moving from the world of facts to the world of values. Ideally, judgments involving risk acceptance should be made on society's behalf by a constitutionally appropriate body. But no such public decision-making process exists. We make do with disparate efforts of individuals, special-interest groups, self-appointed public interest groups, and legislative, judicial, and regulatory systems. However, if at least very large and very small risks were dealt with on the factual basis of effects, the individual and social value systems could be accommodated to some degree and much confusion avoided.

It is human nature to be concerned primarily with effects on our own person and family and secondarily with effects on the population at large. Unfortunately, although we can predict statistical effects on populations, there is no way to predict effects on individuals. This is why fortune-tellers never become as rich as insurance companies. We need then to define actuarially the existing state of well-being and calculate effects on it.

Each person has a probability of dying in any particular year, the value depending mainly on age. The existing probabilities are well known for the United States. For example, in 1975, 1.89 million died out of a population of 213 million, giving an overall probability of 1 in 113. For some specific age groups the values were: 1 to 4 years, 1 in 1425; 5 to 14 years, 1 in 2849; 25 to 34 years, 1 in 692; 55 to 64 years, 1 in 67. We can now answer the question, What does changing a risk do to a person's existing probability of dying? For instance, if a young child were exposed to an additional risk of 1 in 100,000 (0.014 in 1425) in 1975, his overall risk for that year would be 1 in 1425 plus 0.014 in 1425, or 1.014 in 1425.

For the purpose of discussion some guidelines, which may depend somewhat on age, can now be stated in terms of numerical risk:

- 1) Eliminate any risk that carries no benefit or is easily avoided.
- 2) Eliminate any large risk (about 1 in 10,000 per year or greater) that does not carry clearly overriding benefits.
- 3) Ignore for the time being any small risk (about 1 in 100,000 per year or less) that does not fall into category 1.
- 4) Actively study risks falling between these limits, with the view that the risk of taking any proposed action should be weighed against the risk of not taking that action.

Clearly, these suggested guidelines are a gross oversimplification. The unfortunate, overtaken by a one-in-a-million catastrophe, have a 100 percent chance of harm. The hard fact is that attempts to eliminate risks for the unfortunate few tend to markedly increase them for the rest of a large population. This idea is most difficult to defend politically, especially when the unfortunate few are known and the unfortunate many are nameless. In addition, it is necessary to take into account such matters as validity and uncertainty in risk estimates, nonlethal and esthetic effects, voluntary versus involuntary risks, societal abhorrences, and the strange versus the familiar.

Nevertheless, other than depriving the news media of a ready source of attention-grabbing items, the pragmatic de minimis approach should serve to promote understanding about how to deal with risk in the real world; encourage identifiers of risk to provide risk estimates; focus attention on actions that can effectively improve health and welfare and at the same time avoid squandering resources in attempts to reduce small risks while leaving larger ones unattended; and prevent anxiety, apathy, or derision as a response to the increasing recognition that we apparently live in a sea of carcinogens (the "today" risk).—CYRIL L. COMAR, *Professor Emeritus, Cornell University, and Director, Environmental Assessment Department, Electric Power Research Institute, Palo Alto, California 94303*

Accuracy is easy with . . .

the compact Zeiss PM 6 Spectrophotometer with double-grating monochromator and automatic blank reference.

It's so simple, it's foolproof. All you do is:

- 1 put your blank in the first position;
- 2 place samples in the other three positions, or a known standard in the #2 position;
- 3 set the display to absolute absorbance or the desired concentration value;
- 4 push the button for the sample position you want, and the results will be displayed directly either in absorbance or concentration. Kinetic determinations are just as simple.

And it's accurate. You can sample volumes from 20ml to 0.2ml without loss of sensitivity. Read out digitally from —0.300 to

3.000 Absorbance and 0-10,000 Concentration, and expand the scale 10X with great accuracy. Spectral range is 200-800nm with high photometric linearity.

No other instrument in its price range offers a double-grating monochromator.

The PM 6 comes with 4-position motorized and programmable sample changer, or a unique funnel cell for rapid routine determinations. Accessories include a new, inexpensive gel scanner, a thermo-electric temperature control, a multi-speed recorder and a printer.

Write today for complete details and a demonstration.

Nationwide sales and service direct and only from Zeiss.
