AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Something Special

Imagine the world's simplest operating ultracentrifuge. Add the most reliable drive ever designed—the Ultra-Smooth vacuum-encased induction system. Include automatic "Soft-Start," built-in diagnostics and the ability to run every Beckman high performance rotor. Top it off with a most attractive purchase price. And you have the new Model L7-55—the one you have been asking for.

With speeds to 55,000 rpm, forces to 408,000 *g*, integrated circuit logic and remarkably

simple controls, the L7 is ideal for everyday applications. It's the perfect addition to the Beckman family of induction drive ultracentrifuges, joining the premier L8M models—the ultimate in centrifugal research tools—and the Benchtop TL-100 for rapid microvolume separations.

Use the L7 for the routine jobs. Save your L8M for investigations where microprocessor control and memory are an advantage, where delicate gradients call for acceleration/deceleration versatility, where computer

interfacing is needed for remote control or record keeping. When you want to cut run times for these jobs by more than half, use the TL-100.

The workaday Model L7-55: it's something special—especially for you!

To get better acquainted, ask for Brochure SB-667. Beckman Instruments, Inc., Spinco Division, 1050 Page Mill Road, Palo Alto, CA 94304.

Cut your serum needs in half with SerXtend.TM

SerXtend* serum extender is a totally defined combination of cell growth factors that makes ordinary fetal bovine serum go twice as far or more.

It's a consistent, quality-controlled supplement for your cell culture growth media—tested for endotoxin, mycoplasma, adventitious bovine viruses, hepatitis B antigen, *and* cell growth.

With SerXtend, there's less need for lot-to-lot serum testing, fewer endogenous interfering factors, and lower total protein concentration (to simplify purification).

DuPont/Hana Biologics: Serving you together

SerXtend is manufactured for DuPont and its quality is guaranteed by Hana Media, Inc., the leaders in cell culture technology.

*SerXtend is a trademark of Hana Biologics, Inc., Berkeley, CA 94710.

COVER

Section (4.5 by 4.5 millimeters) of a spiral wave of chemical activity traveling through a 1-millimeter layer of a quiescent, excitable Belousov-Zhabotinskii reagent catalyzed by ferroin. The concentration distribution of ferroin was measured by means of a two-dimensional spectrophotometer based on a video camera, a video frame buffer, and a computer. The core of the spiral—a singular site at which the ferroin concentration remains almost constant—is contained within the green circle. The colored curves are Archimedean spirals fitted to isointensity levels that correspond to the lowest (blue) and the highest (red) measured intensities and to the intensity at the core (yellow). See page 661. [S. C. Müller, Max-Planck-Institut für Ernährungsphysiologie, D-4600 Dortmund, Federal Republic of Germany]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

**THE FIFTH ANNUAL CONGRESS FOR
HYBRIDOMA RESEARCH
JANUARY 26 - 29, 1986
BALTIMORE CONVENTION CENTER, BALTIMORE, MARYLAND**

Co-Chairmen:

Zenon Steplewski, The Wistar Institute, Philadelphia, PA • Hilary Koprowski, The Wistar Institute, Philadelphia, PA • Joseph Davie, Washington University, St. Louis, MO

Keynote Speaker: Mark Davis, Stanford University, Stanford, CA **Title:** T-cell Receptor Gene Structure and Function.

We are planning six Working Group Meetings on "Murine Monoclonal Antibodies Available for Clinical Application". These Group Meetings will be restricted to 20 participants each in the following fields:

Group A: Immunohistological Diagnosis

Leader: J. Schlom, NCI, Bethesda, MD

Reporteur: M. Nuti, Laboratorio Di Immunologia, Rome, Italy

Group B: Radioimmunosciintigraphy

Leader: J.-F. Chatal, Center Rene Gauducheau, Nantes, France

Reporteur: J. Powe, Victoria Hospital, Ontario, Canada

Group C: Antigens Shed by Tumor Cells

Leader: R. Bast, Duke University, Durham, NC

Reporteur: J.-Y. Douillard, Center Rene Gauducheau, Nantes, France

Group D: Immunotherapy of Solid Tumors

Leader: A. Houghton, Sloan Kettering Cancer Center, New York, NY

Reporteur: S. Ferrone, New York Medical College, Valhalla, NY

Group E: Immunotherapy of Leukemia and Lymphoma

Leader: J. Ritz, Dana Farber Cancer Institute, Boston, MA

Reporteur: K. Foon, University of Michigan, Ann Arbor, MI

Group F: Immunoconjugates

Leader: K. Krolick, University of Texas, San Antonio, TX

Reporteur: J. Fulton, Southwestern Medical School, Dallas, TX

It is our intent to select participants *actively* involved in the above listed research for in-depth discussion of progress made recently.

The entire day of Monday, January 27, 1986 will be available for these group discussions. The consensus reached by the groups will be presented by the Reporteurs to the whole Congress and results of these discussions will be published in Hybridoma.

Investigators interested in participating in Group Meetings should send a short summary to Dr. Ralph Reisfeld, Scripps Clinic and Research Foundation, 10666 North Torrey Pines Road, La Jolla, California 92037 by November 30, 1985.

Workshop Topics & Chairmen:

HUMAN REPERTOIRE and AUTOIMMUNE DISEASE

A. Notkins, NIH, Bethesda, MD.

GENETIC PROBES IN IMMUNOLOGY

J.D. Capra, University of Texas, Dallas, TX.

MONOCLONAL ANTIBODIES in DISSECTING NORMAL and MALIGNANT STEM CELLS

I. Bernstein, Fred Hutchinson Cancer Center, Seattle, WA.

ISOTYPE SWITCH VARIANTS IN ANALYSIS of ANTIBODY FUNCTION

M. Scharff, Albert Einstein College of Medicine, New York, NY.

Poster Sessions: TECHNOLOGICAL ADVANCES IN HYBRIDOMA RESEARCH

Participants are invited to submit abstracts for the poster sessions. These abstracts will be reviewed up until the time of the meeting; however, only those accepted by Nov. 15 will be published in the journal, Hybridoma. Contact Dr. Zenon Steplewski (215) 898-3924.

Organized by Scherago Associates, Inc., in conjunction with The Journal Hybridoma.

REGISTRATION FEES:

\$400 On-site registration - includes a one year subscription or renewal to the journal, Hybridoma.

\$350 ADVANCE REGISTRATION - (Received by Dec. 1) - Includes a one year subscription or renewal to the journal, Hybridoma.

\$ 75 STUDENT REGISTRATION - Student status must be confirmed in writing by department chairman, does not include Journal subscription.

4-7 registrations received together from same organization \$300 each. Includes 4 journal subscriptions only.

8-10 registrations received together from same organization \$200 each. Includes 4 journal subscriptions only.

Larger group rates available upon request.

Cancellations must be received in writing by December 19, 1985.

Attendance will be limited. Make checks payable to: **Scherago Associates, Inc., DNA/HYBRIDOMA**

Subsistence survival

A nomadic tribe of 10,000 people in Kenya has survived for generations despite recurring droughts by making ecologically appropriate use of its 85,000 sheep and goats, 10,000 camels, 10,000 cows, and 5,000 donkeys (page 619). Coughenour *et al.* describe the food web through which solar energy flows from plants to livestock and then to the people. Energy utilization emphasizes survival, not productivity (a Western value), and the web's structure presumably accounts for the system's stability. Camel milk is the most reliable food since camels feed on woody plants that do not require continuing rainfall. Opportunistic use is made in wet seasons of cattle (which feed on more water-dependent plants), and contingency use is made of animal meat and blood when milk is in short supply. The needs of the people are met, their life-style remains in balance with the low-productivity environment, and there is little evidence that this pastoral system degrades the environment.

Gene for the IL-2 receptor

Molecular characteristics of genes that code for human interleukin-2 (IL-2) receptors are similar in normal T lymphocytes and in leukemic T cells infected by HTLV-I virus (page 633). Leonard *et al.* found that, in normal cells, eight gene regions are spliced together; messenger molecules made from this genetic template then direct synthesis of receptor proteins. Reading of the messenger can begin at two sites in normal cells; a third site was found in leukemic genes. Normal and leukemic genes had the same base sequence, and, from each, multiple messenger molecules were assembled. IL-2 receptors are critical to maturation of normal T lymphocytes; since they are present in greater than normal numbers on leukemic cells, they may also play a crucial role in the development of these cells.

Chemical reaction makes TV debut

A "video" has been made showing details of a chemical reaction (page 661). Müller *et al.* recorded and analyzed the traveling wave (cover) generated in the Belousov-Zhabotinskii reaction (metal-catalyzed oxidation and decarboxylation of an organic acid). In the reaction, a circular wave propagates outward; rhythmic color variations are visible as a catalyst indicator shifts between two states of excitation. The traveling circular wave, if disrupted by a gentle air blast, becomes a spiral wave that can be described mathematically. The center of the pattern is of particular interest: a slight variation in reactants was sufficient to initiate the system's reactivity. Data describing the core, shape, and propagation of the wave will be applicable to pattern formation in embryonic development and in mathematical equations and to rhythmic phenomena in nature such as impulse transmissions along nerve and muscle fibers.

Possible cause of psoriasis

Psoriasis, a common skin disease, may be caused by a factor secreted by skin fibroblasts (page 669). Red lesions with scaly, silvery surfaces contain dividing keratinocytes, the cells that synthesize proteins essential for skin, hair, and nails. Beneath the lesions, edema, capillary dilatation, and inflammation occur. Saiag *et al.* inserted a plug of psoriatic or normal human skin into a "skin equivalent" made of matrix materials and cells of the outer (epidermal) and deeper (dermal) layers of skin. In all cases, a multilayered epidermis developed. Keratinocytes from normal and psoriatic sources hyperproliferated when dermal fibroblasts in the skin equivalent were from a psoriatic donor. Fibroblasts from a normal donor did not cause hyperproliferation of normal keratinocytes or keratinocytes from asymptomatic areas of psoriatic skin. Keratinocytes from lesions proliferated faster than did normal ones or those from uninvolved areas of psoriatic skin; their hyperproliferation could not be suppressed by normal fibroblasts. Thus, psoriatic pathology involves a fibroblast factor that is capable of disrupting proper functioning of keratin-producing cells.

Metal binder in plants

Plants contain simple peptides, named phytochelatins, that bind heavy metals and thus participate in metal detoxification (page 674). In cultures of cells from several plant species, phytochelatins were inducible by cadmium, copper, mercury, lead, and zinc. More than 90 percent of the cadmium put into cultures became complexed with phytochelatins. Grill *et al.* established that the phytochelatins are small linear polymers of glutamic acid, cysteine, and glycine; the exact sequence of amino acids was determined and confirmed by chemical synthesis. Although metal chelators in vertebrates and fungi are much larger and different in structure, a similar mechanism—metal complexed with organic sulfur—seems to be used for detoxification purposes.

Periodicity of the DNA helix

The shape of a DNA molecule can be related to how the molecule works by a new fragmentation technique (page 679). When DNA is attached to an inorganic precipitate, a simple chemical "knife"—iron(II) EDTA—will cut the DNA backbone in a way that reflects base composition and helical periodicity. In a prototype experiment, Tullius and Dombroski studied the fragmentation of the promoter region of the thymidine kinase gene of herpes virus DNA. The structure of the DNA molecule was elaborated through analysis of the digest. Shapes taken by base sequences in their natural contexts in genes can now be compared with those of simple base sequences previously determined through high-resolution studies.

LKB offers you a choice of two

This one combines fi

If it's genuine versatility you're looking for, then you need look no further than the LKB Vertical Electrophoresis System. With a dual gel capacity that allows you to run up to 40 samples at a time, its design ensures that all gels are always run under uniform conditions, thereby guaranteeing superior reproducibility. And now we have further enhanced the already impressive versatility of this system by adding a 30 cm gel capability for even higher resolution, a tube gel kit for greater 2-D flexibility, and the new LKB Transphor Electroblotting Unit for improved visualization.

This fine 2-D gel shows the use of the LKB Gel Dryer in preparing gels for storage, scanning or autoradiography ▼

THE LKB SYSTEMS APPROACH

At LKB we believe that we should be able to give you professional training, advice and support in the use and application of our products. And we should certainly be able to supply you with everything you need to perform your experiments, so you never have to worry about where each item comes from, how good it is, whether it will work properly with all the other pieces of apparatus, and who to turn to when you have problems. That is why we offer complete integrated systems, not merely a range of individual units. LKB systems contain all the instruments, kits, chemicals, accessories and supplies you will need in your laboratory. Every component of the system is designed to work together with and enhance the high performance of all the other components. Every item carries our name, and we take full responsibility for it.

LKB - the electrophoresis experts

No grease, no leaks, no mess

One clear benefit of using the LKB Vertical Electrophoresis System is the simplicity it brings to the job of gel casting. The basic system includes everything you need to cast and run perfect gels first time, every time. The gels are cast between glass plates, avoiding both the use of grease and the probability of leaks and turning gel casting into a clean and pleasant activity.

The Tube Gel Kit allows the LKB system to perform both the first and second dimensions in 2-D applications ►

PAGE and gradient PAGE techniques

Conventional PAGE and SDS/PAGE techniques, using either continuous or discontinuous buffers, are fully catered for by the basic LKB system. The addition of our Gradient Gel Kit provides a quick and convenient method of casting both linear and exponential gradient polyacrylamide gels. Due to their relatively small pore size, these gels effectively limit diffusion. Linear gradients counteract band broadening effects, while exponential gradients are useful for resolving components with widely differing molecular weights.

The Vertical Electrophoresis System, based on the LKB 2001 Electrophoresis Unit, also includes a power supply, thermostatic circulator and all the necessary accessories, kits and quality chemicals ▼

Vertical Electrophoresis Systems

ve different techniques

Agarose gel techniques

For researchers who sometimes want to use agarose, there is a special kit to help you cast and run the 3 mm agarose gels on the LKB Vertical Electrophoresis System. The kit includes frosted glass plates to provide essential support for the gel.

Two-dimensional techniques

This is the only complete vertical electrophoresis system that can carry out both the first and second phases of 2-D electrophoresis in a single unit, and can offer the user a choice of either tube or slab gels for the first dimension. Our 2-D Kit includes a special cleaver for preparing slab gels, while tube gels are easily applied to the top of a standard slab gel by means of the trough built into the upper buffer chamber.

LKB's new Transphor Electrophoresis Unit improves the sensitivity and resolution of detection procedures ►

Autoradiography techniques

Another kit, containing all the accessories you need to cast accurate gels only 0.75 mm thick, makes it easy for you to use the LKB Vertical Electrophoresis System for high resolution autoradiography using thin gels. The LKB Slab Gel Dryer, which combines dry heat and reduced pressure to rapidly dry and affix the gel onto paper or film for later analysis and storage, is ideal for drying down thin gels onto disposable plastic sheets prior to detection.

*The result of gradient gel electrophoresis of two crude extracts from *Beneckea harveyi* on the LKB system ▼*

Electroblotting techniques

The new LKB Transphor uses the principles of electrophoresis to transfer proteins or nucleic acids from polyacrylamide or agarose gels onto nitrocellulose or other immobilizing matrices. In this way the electrophoresis bands are made easily accessible for faster and more sensitive visualization than on the original gel. The resulting patterns can be stored for months without deteriorating and multiple analyses can be performed using just the one pattern.

Want proof?

These may sound like extravagant claims, but just call us and we'll be happy to come and demonstrate the versatility of the LKB Vertical Electrophoresis System for you and your colleagues. At your convenience.

WHY GAMBLE?

Excessive levels of contaminants in food and drinking water can now be easily avoided with E-Z SCREEN, the totally new process of sample screening in the field, office or laboratory.

This technology expands analytical testing for the detection of toxic and hazardous substances. For example, the new sulfamethazine E-Z SCREEN will monitor for excessive levels of sulfa residue in pork.

Current E-Z SCREEN kits include (in addition to those shown):
Tylosin - 100 ppb
Gentamicin - 100 ppb
Paraquat - 200 ppb
Triton - 1000 ppb
Plus 16 others under development.

- **RAPID RESULTS**
in five minutes or less.
- **HIGH SENSITIVITY**
ppb or less.
- **SPECIFICITY**
unique immunoassay
- **INEXPENSIVE**
- **EASY-TO-USE**
- **NO INSTRUMENTATION**
- **REQUIRES ONLY 1 OR 2 DROPS**
of sample or reagent.

The Boundary Dynamic

The Boundary Dynamic

The performance of a polymeric adhesive depends on the properties and composition of its surface. Now a scientist at the General Motors Research Laboratories has developed and validated a theory that describes the coupled effects of diffusion and chemical reaction on the changing surfaces not only of adhesives, but of chemically reacting surfactant systems in general.

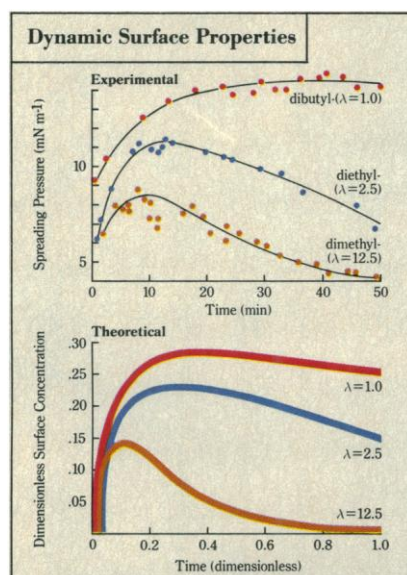

Figure 1: Experimental measurements of spreading pressure v. time for dialkylaminopropylamines with various Damköhler numbers (λ), and corresponding theoretical calculations of surface concentrations.

Figure 2: Evolution of an adhesive surface: Surface-active Solute 1 (red) reacts with host resin (pink tone) to form surface active Solute 2 (brown).

THE USE OF adhesives in the production of an automobile promises to make both the product and the process more efficient. Both weight and operations can be reduced. In practice, however, steel and other metallic surfaces are often contaminated by process lubricants. A durable bond depends on the ability of an adhesive to displace contaminants and to wet the substrate.

Assuring intimate contact between adhesive and substrate requires detailed knowledge of adhesive surface tension, since it is this property that controls displacement of contaminants and wetting. Up to now the surface tension of an adhesive has typically been assumed constant. In reality, though, surface-active components in the adhesive collect preferentially at the interface and also react, so that the surface composition varies with time, giving rise to dynamic surface tension. Variations can be large enough to significantly affect

adhesive performance.

The understanding of time-dependent surface tension has been advanced by the work of Dr. Robert Foister, a scientist at the General Motors Research Laboratories. Investigation of dynamic surface properties of thermosetting adhesives led him to develop a general theory of adsorption kinetics in binary, chemically reacting surfactant systems. The significance of this theory is that it includes the coupled effects of surfactant diffusion and chemical reaction, making it possible for the first time to describe quantitatively the changing surfaces of such systems.

In a typical adhesive that polymerizes, or "cures," by chemical reaction (Figure 2), a surface-active curing agent (Solute 1) reacts with the host resin to form a second surface-active species (Solute 2) that is also reactive. Both solutes migrate to the surface, lowering the surface tension. Diffusion to the surface is driven by a potential energy gradient between the surface and the bulk, with the solute molecules experiencing a lower energy at the surface.

Dr. Foister derived appropriate transport equations to describe diffusion and chemical reaction in the bulk, in a subsurface region, and at the surface itself. The transport equations can be solved analytically if the chemical rate equations are assumed to be first order in the concentrations of reacting species, and if the subsurface and surface concentrations can be related to one another by a linear adsorption isotherm. For more complicated isotherms, a set of coupled, non-linear integral equations is generated.

These must be solved numerically.

Analytical solution for the special case of the linear isotherm indicated that the change with time in surface concentration (and consequently in surface tension) is composed of two terms: first the diffusive flux of Solute 1 into the subsurface from the bulk, and second the depletion of this solute due to chemical reaction. Hence, the surface concentration of Solute 1 exhibits a maximum with time (Figure 2). This maximum in surface concentration corresponds to a minimum in surface tension.

MODIFYING the transport equations to include binary adsorption isotherms allowed for consideration of competitive adsorption of the two reacting and diffusing solutes. By solving these equations numerically and conducting dimensional analysis, Dr. Foister identified various dimensionless parameters as predictors of system behavior. The most important of these parameters was a dimensionless number (λ), of the Damköhler type, involving terms representative of reaction, diffusion, and adsorption.

$$\lambda = \frac{k (\Gamma_m a)^2}{4D}$$

Here k is the reaction rate constant of Solute 1, D its diffusivity, Γ_m its "surface capacity" (the maximum number of molecules absorbed per unit surface area), and a its "surface affinity" (a measure of its energy of adsorption). For an adhesive, lowering λ by reducing k (the reactivity of the curing agent), for example, would

prolong the time to maximum, and would increase the value of the surface concentration at the maximum (see Figure 1, Theoretical). As a practical consequence, this would improve wetting by minimizing the surface tension.

In experiments using a series of dialkylaminopropylamine curing agents (dimethyl-, diethyl-, and dibutyl-) in a host epoxy resin matrix, good agreement has been demonstrated between theoretical predictions for surface concentration and the measured dynamic spreading pressure, which is the change in adhesive system surface tension due to the curing agent (Figure 1, Experimental).

"I expect," says Dr. Foister, "that the physical insights gained from this analysis can be applied to other reactive surfactant systems by using specifically tailored isotherms and chemical reaction schemes. Predicting surface behavior can certainly help us design better adhesives for specific applications, but it is also pertinent to the performance of anti-oxidants and anti-ozonants in synthetic rubber, for example. And applied to interfaces in biological systems, a suitably modified theory may prove valuable in understanding the phenomenon of enzyme activity."

THE MAN BEHIND THE WORK

Dr. Foister is a Staff Research Scientist in the Polymers Department at the General Motors Research Laboratories.

Dr. Foister received his undergraduate degree from Guilford College, and holds a Ph.D. in Physical Chemistry from the University of North Carolina at Chapel Hill. His thesis dealt with the role of liquid inertia in the intrinsic viscosities of rod-like polymers.

He did post-doctoral work in Canada as a Fellow at McGill University in Montreal, and in the Applied Chemistry Division of the Pulp and Paper Research Institute of Canada, working on the micro-rheology of colloidal dispersions.

Dr. Foister joined General Motors in 1980. He is the leader of the Structural Adhesives Group in the GMR Polymers Department. His current research interests center on surface chemistry and adhesion.

ASTRONOMY & ASTROPHYSICS

This volume contains 24 articles published in *Science* between 1982–84, ranging from the solar system to the pulsars at the very edge of the observable universe. Research techniques and instruments described cover such diverse topics as proton decay, the Very Large Array, and the planned Space Station as a platform for future experiments.

Each article is self-contained, yet as a whole, the volume reveals a broad, coherent, and contemporary picture of our astronomical universe. Selected for their depth of coverage and breadth of topics by Morton S. Roberts, Director of the National Radio Astronomy Observatory, these articles are of interest to the entire scientific community.

Contents

I. SOLAR SYSTEM

Sun's Influence on Earth's Atmosphere and Interplanetary Space, *J.V. Evans*
Solar Flares, Proton Showers, and Space Shuttle, *D.M. Rust*
Cosmic-Ray Record in Solar System Matter, *R.C. Reedy, J.R. Arnold, D. Lal*
Ultraviolet Spectroscopy and Composition of Cometary Ice, *P.D. Feldman*

II. STRUCTURE AND CONTENT OF THE GALAXY

New Milky Way, *L. Blitz, M. Fich, S. Kulkarni*
Most Luminous Stars, *R.M. Humphreys and K. Davidson*
Chromospheres, Transition Regions, and Coronas, *E. Böhm-Vitense*
Interstellar Matter and Chemical Evolution, *M. Peimbert, A. Serrano, S. Torres-Peimbert*
Formation of Stellar Systems from Interstellar Molecular Clouds, *R.D. Gehrz, D.C. Black, P.M. Solomon*
Binary Stars, *B. Paczyński*

Dynamics of Globular Clusters, *L. Spitzer, Jr.*
Magnetic Activity of Sunlike Stars, *A.H. Vaughan*
Stars, Their Evolution and Stability, *S. Chandrasekhar*

III. GALAXIES AND COSMOLOGY

Most Distant Known Galaxies, *R.G. Kron*
Galactic Evolution...*K.M. Strom and S.E. Strom*
Rotation of Spiral Galaxies, *V.C. Rubin*
Quasars and Gravitational Lenses, *E.L. Turner*

OLYMPUS®

The Image of Quality

Introducing the New VANOX. A breakthrough in research capability.

The quality of any research microscope relies on the interrelationship of optical performance, computer intelligence and mechanical capability. For more than six decades, Olympus has dedicated itself to development of a unique fusion of these distinct disciplines.

Nowhere is this achievement better exemplified than in the all-new Vanox Research Microscope System. An innovative concept that *builds into* the System's models a broad range of skills and versatility traditionally requiring attachments, accessories and add-ons to limited-capability microscopes...all make the new Vanox the most significant contribution to research microscopes in over a decade.

Some of the *built-in* innovations include three photographic ports for cine, 35mm or large format cameras, auto-exposure with spot or integrated measurements, light balancing filters, choice of condensers and illuminators, including Koehler, and so much more that only a hands-on experience can attempt to show the breakthrough quality of the new Vanox models. Arrange a demonstration now by contacting Olympus Corporation, Precision Instrument Division, 4 Nevada Drive, Lake Success, NY 11042-1179. Phone toll-free 1 (800) 446-5967.

THE LIGHT OF DISCOVERY

MICROPHOT

Now the most advanced, integrated and versatile instrument for research light microscopy... The Nikon Microphot. So advanced it will enhance the very process of discovery itself.

Available in two models, the Microphot FX has a built-in camera, while the Microphot may be equipped with any camera from Nikon's FX system.

The Microphot FX microscope uses a microprocessor and software program to provide flawless, automatic photography. Features include binocular focusing for photography with *moveable* 1% spot metering or 30% averaging. FX direct-projection provides fast shutter speeds, maximum metering sensitivity, and reduced glare and flare.

Both the Microphot FX and Microphot allow you to perform *all* viewing and analytical techniques in transmitted and reflected light... with a single instrument. You have the option of multiple functions simultaneously—photomicrography, image analysis, CCTV, microspectrophotometry.

Discover the Microphot FX and Microphot for yourself. Contact Nikon Inc., Instrument Group, 623 Stewart Avenue, Garden City, New York 11530. (516) 222-0200.

Air Pollution and Acid Rain

Research being conducted on air pollution and acid rain is leading to a changing picture of the relative importance of SO₂ and NO_x. Political and regulatory efforts have been focused on sulfur oxides because they produced about twice as much acid as NO_x. However, that emphasis disregards the role of NO_x in the formation of toxic photochemical oxidants. Controlled studies at experimental facilities and observations in the field have identified effects of ozone and NO_x as more damaging to vegetation than SO₂ alone.

In sunlight a complex series of reactions occurs in the troposphere, including photolysis of NO₂ to produce excited atomic oxygen and thence ozone. Additional reactive species formed include hydrogen peroxide, methyl hydroperoxide, peroxyacetic acid, and reactive free radicals, including OH, NO₃, and HO₂. Maxima in the amounts of these species usually occur between 9:00 a.m. and 4:00 p.m. in midsummer. Monitoring has revealed considerable variability in concentrations of the oxidizing pollutants related to abundance of the input substances. Some ozone may be present that originates in the stratosphere.

It has been known that SO₂, NO_x, and O₃ can have toxic effects on plants. In the early days, experiments tended to be performed "scientifically"; that is, plants were exposed in chambers in which the chemicals were tested one at a time. Under those circumstances, it was noted that concentrations of SO₂ and NO₂ greater than ambient were required to produce notable pathology. Indeed, low concentrations of NO₂ were sometimes beneficial (perhaps a fertilizer effect). However, in the real world, pollutants are present together. When experiments were conducted with ambient midday levels of ozone present (for example, 50 to 100 parts per billion), toxicity was noted. When the ozone was supplemented with NO₂, there was usually a substantial additional toxicity attributable to NO₂. Similar results were noted when ozone was supplemented with SO₂.

The deleterious effects of ozone on agricultural crops have been documented and analyzed in a report* issued by the Environmental Protection Agency. It is estimated that a reduction in ambient ozone levels of 25 percent would produce nearly \$2 billion in benefits, while a 25 percent increase in ozone would lead to an additional \$2.3 billion in crop losses.

The photochemical oxidants, particularly OH, have an important role in the oxidation of SO₂ leading to H₂SO₄. In the summer, with abundant OH present, the oxidation proceeds much more rapidly than in winter. Sulfur dioxide emissions in winter and summer are about the same, but the total deposition of sulfate in January and February at stations in northeastern states was found to be a third or less than what it was in midsummer. Deposition of nitrate showed little seasonal effect. Thus, at the crucial time of the spring runoff, the contribution of nitric acid was about equivalent to that of sulfuric acid.

Initiatives to reduce acid rain tend to be centered on the electrical utilities and on their emissions of SO₂. When new coal-fired plants are built, they are required to include facilities for flue gas desulfurization. This adds substantially to the cost of the plant, decreases the efficiency of energy conversion to electricity, and diminishes overall reliability. While the process is effective in capturing SO₂, it is ineffective in removing NO. Any program aimed at reducing acid rain should take into consideration the total air pollution problem, including NO_x. Efforts to reduce SO₂ emissions should be accompanied by a corresponding emphasis on reducing NO_x, whatever the source. For the electrical utilities, this would mean providing more flexibility to use technologies that reduce both SO₂ and NO_x. But in addition, the other large contributors to NO_x, such as motor vehicles, should come under scrutiny.—PHILIP H. ABELSON

The CRAY supercomputer

ATTENTION!

We interrupt this ad to announce a breakthrough in supercomputing services.

X-MPower from Boeing.

We've combined a Cray X-MP Supercomputer with a Solid-State Storage Device (SSD) that packs a whopping 128 million words.

And it's available now via our international teleprocessing network.

This isn't just a better mousetrap. It's a total revolution in computing power.

Not only are we solving current research and design problems at amazing speeds, we're changing the way scientists and engineers think about solving problems. Here's why.

LIGHTNING FAST JOB TURN-AROUNDS. The X-MP is 30 percent faster on scalar jobs than the Cray 1S, the old efficiency champ. For vectorized jobs, it runs from 2 to 3 up to 10 times faster. Best of all, the SSD is 100 to 250 times faster than disks. The result? I/O problems become a thing of the past. And CPU time will almost equal turnaround time.

Recently, one group of researchers took only 3.6 hours to solve a seismic, 3-D migration problem that would have taken 23.8 hours! And for the structural analysis of an offshore platform, the X-MP turned a 28-hour CYBER 760 job into a 26-minute snap.

ACCELERATES RESEARCH AND DESIGN. The X-MP lets you do more computer runs in the time you've got for the same price or less. That squeezes more results out of your R&D dollar. And brings them in on time.

OPENS UP NEW WAYS TO SOLVE PROBLEMS. Because you have so much more calculating power, you can not only run current problems faster, but you can develop totally new algorithms as well. Totally new approaches to old problems!

These are big claims.

That's why we want a chance to tell you more. We've got more data than we can cram into one ad. Such as the X-MP's incredible versatility. In manufacturing. Oil and gas extractions. Telecommunications. Pharmaceuticals. Nuclear power. And more. Plus, you'll have full access to our MAINSTREAM® time-sharing services and our engineering and scientific software library.

To get the whole story, call Bob Nicholson today at (206) 763-5097. Or write Boeing Computer Services, P.O. Box 24346, M/S 7A-33, Seattle, WA 98124.

Scholar/Teacher
For four years
can't touch
mainframe
unsurpassed

1. The easiest to use. Available. If you learn... even computer background.
2. The most powerful analysis capabilities.
3. Mainframe compatibility. Capable of running other CBT systems.
4. With more flexibility, Scholar/Teacher cost CBT systems or compatible.

Now it's even better. For reasons the computer won't think about.

We've kept it simple. But it's flexible enough to grow with you as your

Sorvall® We've got a centrifuge that's just your speed

SORVALL® gives you a choice of models in every speed range to accelerate results in any specific lab application:

Ultraspeed

RC-Ultras—The 60/70/80,000 rpm centrifuges that create extra time!

New microcomputer helps you utilize time more efficiently than ever: ☐ files up to 10 programs and recalls for repetitive runs ☐ ω^2dt calculated automatically ☐ advanced 5-phase "Step Mode" changes rotor speed automatically to enhance gradient separations ☐ complete printout of run and rotor data.

OTD-B Ultras—A line of 55/65/75,000 rpm centrifuges priced to fit your laboratory budget

These models offer an excellent combination of low price plus maximum functions to meet day-to-day research requirements.

Superspeed

RC-5C—The most versatile 21,000 rpm centrifuge a lab can own!

Advanced microcomputer control offers: ☐ built-in g-force display and ω^2dt integrator ☐ automatic rate control ☐ no vacuum required to maintain speed and temperature ☐ uses your existing SORVALL® rotor inventory.

Also available is the efficient, economical RC-5B model, the most widely-used superspeed in the world.

Lowspeed

RC-3C—The 6,000 rpm centrifuge with programmable controls for automatic reproducibility from run to run

This model offers: ☐ 10-program memory ☐ ω^2dt integrator ☐ automatic g-force display ☐ spins 6 liters to max RCF of 7,280 x g. If fewer built-in features are needed but you still require 6-liter capacity, ask for the reliable RC-3B.
