

so do membrane-associated traits, exemplified by elliptocytosis. Once again I am impressed with the foresight of J. B. S. Haldane, who four decades ago suggested that malaria has been a major selective force in human populations and accounts for the high frequency of hemoglobin disease in several parts of the world.

Two papers discuss the Black Carib populations in Latin America and show the power of simultaneous use of historical data and genetic analysis. The final section of the book is a heterogeneous collection of four papers on dermatoglyphics, color vision, nutrition and body size, and the use of genetic isolates for genetic research.

As is usual in symposium volumes, the individual papers are uneven in quality and interest. They range from straightforward descriptions of methods and presentation of data to more speculative pieces. Probably only people in the field will want to read them all, but most students of human evolution will find items of interest. Some of the papers suffer from the rapid increase in knowledge since the symposium was held.

I want to register my appreciation that, unlike some symposium volumes, this book has an index. I found myself using it frequently, and other readers will probably do the same.

The Calcichordate Theory

The Ancestry of the Vertebrates. R. P. S. JEFFERIES. British Museum (Natural History), London, 1986. viii, 376 pp., illus. £50.

Since 1967, Richard Jefferies of the British Museum has been arguing in a long series of taxonomic and general papers that an unusual group of relatively rare early Paleozoic fossil echinoderms (called stylophorans, or in his terminology calcichordates) are the direct ancestors of vertebrates. Jefferies has convinced a few echinoderm paleontologists that his calcichordate theory is correct, but most vertebrate morphologists or paleontologists still subscribe to Garstang's proposed derivation of vertebrates from the paedomorphic larval stage of a tunicate. Jefferies has now written a lengthy book reviewing all of the arguments for (and many of those against) his calcichordate theory.

Jefferies is a leading proponent of the application of cladistic analysis to fossils to obtain information for phylogenetic reconstructions. He discusses this methodology in

chapter 1, where he also gives a brief summary of previous work on calcichordates. The anatomy and embryology of living deuterostomes (hemichordates, echinoderms, acraniates, tunicates, and vertebrates) are exhaustively reviewed in chapters 2 through 6. Jefferies then describes the skeletal morphology and reconstructed internal soft parts of the two groups of fossil calcichordates, the somewhat older and more primitive cornutes in chapter 7 (based on seven genera) and the somewhat younger and more advanced mitrates in chapter 8 (based on eight genera plus *Pikaia*, a probable acriate from the Middle Cambrian Burgess Shale). In chapter 9, he combines the information from previous chapters to produce phylogenetic charts for cornutes ("stem chordates") and for mitrates ("primitive crown chordates") plus a cladogram showing that different mitrates were ancestral to living acraniates, tunicates, and vertebrates. The last chapter reviews (and attempts to refute) other theories about the origin of chordates (those of Løvtrup, Garstang, and Northcutt and Gans) and two other interpretations of calcichordate anatomy (Ubaghs's aulacophore theory and Philip's stele theory), in both of which the calcichordates are considered to be true echinoderms not closely related to vertebrates.

Jefferies's book is well written, well illustrated, and useful in many places, especially the reviews of the anatomy and embryology of the various deuterostome groups, the exposition of cladistic methodology and its use in analyzing calcichordate relationships based on skeletal morphology, and the discussion of competing theories about calcichordates. But Jefferies is not completely successful in demonstrating that his calcichordate theory is correct, the main reason for writing this book. His reliance on Haeckel's law to test relationships, the dominance of recapitulation over paedomorphosis in most cases, and the fact that he does not always use the rigorous cladistic methodology presented in chapter 1 are worrisome. His identification of the large pyramid-covered opening in *Cothurnocystis* and other calcichordates as the mouth (pp. 197–198) may not be correct. Nearly identical pyramid-covered openings in other echinoderms are known to be the anus, and this conclusion also applies to some advanced mitrates where the same opening is covered by a single large flat plate that is movable or hinged. If this opening is the anus and not the mouth, then everything is backwards and the calcichordate theory breaks down immediately. Each lineage of mitrates leading to acraniates, tunicates, and vertebrates loses its plated skeleton in the transition (and vertebrates develop an entirely new

bony skeleton), a rather unlikely series of events considering that other mitrates with their typical echinoderm-type plated skeletons continued on for millions of years longer in the fossil record. Also at this transition, there are major differences in appearance between the latest mitrate ancestor and Jefferies's "hypothetical animal s" (p. 341), representing his earliest crown vertebrate.

In conclusion, this book is a very good summary of the calcichordate theory for the origin of vertebrates and the main data supporting it, but I am still not convinced that Jefferies has found the correct solution to this important and controversial problem.

American Chemistry

Essays on the History of Organic Chemistry in the United States, 1875–1955. DEAN STANLEY TARBELL and ANN TRACY TARBELL. Folio, Nashville, TN, 1986. x, 434 pp., illus. \$19.95.

This book is a giant first step toward the development of a full history of organic chemistry in the United States. The authors undertook the monumental task of reviewing American contributions to the literature of organic chemistry from 1875 to 1955 and distilling their reading into a series of essays, each of which can stand alone but which together give a fairly complete picture of the growth of American organic chemistry.

The book is arranged according to four time periods and further divided according to subject areas. The authors were, fortunately, not totally constrained by either the time periods or the research areas, and there is frequent overlap, which makes for a more readable and more interesting text. The time periods are: before 1875; from 1875 to 1914 (the beginning of World War I); from 1914 to 1939 (the beginning of World War II); and from 1940 to 1955. The areas of interest covered for each period include synthesis, structural studies and stereochemistry, natural products, and physical organic chemistry, but there are also several chapters on special topics. Early chapters on the American background prior to 1875, Johns Hopkins University and Ira Remsen, and chemical laboratories, chemical instruction, and chemical journals, which outline the context in which American organic chemistry developed and set the stage for the discussion that follows, can be read by almost anyone. Most of the book, however,

will be accessible only to chemists, though not necessarily only those who specialize in organic chemistry. Many of the chapters devoted to chemistry are mini-encyclopedic accounts of technical developments, although the chemistry is liberally interspersed with biographical sketches of the major contributing chemists. The book can be read straight through for an almost chronological account of the development of organic chemistry in the United States or selectively for an overview of a given research area.

Tarbell and Tarbell both have Ph.D.'s in organic chemistry, and Stanley Tarbell was a major contributor in the field for over 40 years. They have been studying and writing about the development of organic chemistry in the United States for some time and in 1981 published a major biography of Roger Adams. Because of the nature of Stanley Tarbell's training and much of his research we expect, and get, a very good account of physical organic chemistry. There is also exceptionally good coverage of natural products. (One of the highlights of Tarbell's career was his determination of the structure of fumagillin.) The chapter entitled "The instrumental revolution" is also particularly strong. It contains a good, albeit brief, account of most of the major modern instruments, discusses the changes in organic chemistry wrought by the advent of sophisticated instrumentation, and includes some acute comments on the effects of high technology and its costs on educational institutions. Throughout the book there are apt comments on chemical, institutional, and social changes.

In general the book is well edited, but there are occasional errors in nomenclature and structures. The most embarrassing error must be the misspelling of one author's name on the book cover.

There is a great deal of work yet to be done on the history of organic chemistry in the United States, but the Tarbells have done a great service by pointing the way. At the very least this book will serve as a primer of the recent past for teachers and advanced students of organic chemistry, and at best, it will give birth to a long series of doctoral theses, articles, and books by historians of chemistry.

Books Received

Aggregation and Fractal Aggregates. R. Jullien and R. Botet, World Scientific, Singapore, 1987 (U.S.

distributor, Taylor and Francis, Philadelphia). x, 120 pp., illus. \$28.

Aging and the Immune Response. Cellular and Humoral Aspects. Edmond A. Goidl, Ed. Dekker, New York, 1987. xiv, 364 pp., illus. \$79.75. Immunology Series, vol. 31.

AIDS Education. The Public Health Challenge. Carolyn Siegel, Ed. Health Education Quarterly (Wiley), New York, 1986. Paper, \$25.95. *Health Education Quarterly*, vol. 13, no. 4 (pp. 285-432).

Allelochemicals. Role in Agriculture and Forestry. George R. Waller, Ed. American Chemical Society, Washington, DC, 1987. xviii, 606 pp., illus. \$94.95. Based on a symposium, Chicago, Sept. 1985.

The Body Electric. Electromagnetism and the Foundation of Life. Robert O. Becker and Gary Selden. Illustrated by David Bichell. Quill (Morrow), New York, 1987. 365 pp. Paper, \$8.95. Reprint, 1985 edition.

The Brain Code. Mechanisms of Information Transfer and the Role of the Corpus Callosum. Norman D. Cook. Methuen, New York, 1987. xvi, 256 pp., illus. \$35.

Breasts, Bottles and Babies. A History of Infant Feeding. Valerie A. Fildes. Edinburgh University Press, Edinburgh, 1986 (U.S. distributor, Columbia University Press, New York). xxviii, 462 pp., illus. \$30.

Carbon-13 NMR Spectroscopy. High-Resolution Methods and Applications in Organic Chemistry and Biochemistry. Eberhard Breitmaier and Wolfgang Voelter. 3rd ed. VCH, New York, 1987. xvi, 515 pp., illus. \$135.

Cell Culture and Somatic Cell Genetics of Plants. Vol. 3, Plant Regeneration and Genetic Variability. Indra K. Vasil, Ed. Academic Press, Orlando, FL, 1986. xx, 657 pp., illus. \$79.

Cell Cycle and Oncogenes. Widmar Tanner and Dieter Gallwitz, Eds. Springer-Verlag, New York, 1986. viii, 171 pp., illus. \$54.50. From a colloquium, Mosbach/Baden, F.R.G., April 1986.

Dynamic Macroeconomic Theory. Thomas J. Sargent. Harvard University Press, Cambridge, MA, 1987. xiv, 369 pp. \$35.

Dynamic Processes in the Chemistry of the Upper Ocean. J. D. Burton, P. G. Brewer, and R. Chesseelet, Eds. Plenum, New York, 1986. viii, 246 pp., illus. \$49.50. NATO Conference Series IV, Marine Sciences, vol. 17. From an institute, Jauy-en-Josas, France, July 1983.

Dynamic Properties of Glia Cells II. Cellular and Molecular Aspects. T. Grisar *et al.*, Eds. Pergamon, New York, 1986. xviii, 424 pp., illus. \$85. Advances in the Biosciences, vol. 61. From a symposium, Liège, Belgium, May 1985.

Early Neolithic Settlement and Society at Olszanica. Sarunas Milisauskas. University of Michigan Museum of Anthropology, Ann Arbor, MI, 1986. xx, 319 pp., illus. Paper, \$20. Museum of Anthropology Memoir no. 19.

Geometry of Nonlinear Field Theories. Roberto Percacci. World Scientific, Singapore, 1986 (U.S. distributor, Taylor and Francis, Philadelphia). x, 255 pp., illus. \$33.

Geophysical Methods in Geology. P. V. Sharma. 2nd ed. Elsevier, New York, 1986. xx, 442 pp., illus. \$37.50.

GIREP Conference 1986. (Copenhagen, Aug. 1986.) COSMOS- and Educational Challenge. European Space Agency, Paris, 1986. viii, 450 pp., illus. Paper, \$24. ESA SP-253.

Gravitational Collapse and Relativity. Humitaka Sato and Takashi Nakamura, Eds. World Scientific, Singapore, 1986 (U.S. distributor, Taylor and Francis, Philadelphia). xiv, 512 pp., illus. \$72. Yamada Conference XIV (Kyoto, Japan, April 1986).

The Hall of Heavenly Records. Korean Astronomical Instruments and Clocks, 1380-1780. Joseph Needham *et al.* Cambridge University Press, New York, 1986. xxii, 201 pp., illus. \$44.50.

A Handbook of Introductory Statistical Methods. C. Philip Cox. Wiley, New York, 1987. xxiv, 272 pp., illus. \$34.95. Wiley Series in Probability and Mathematical Statistics.

Insect Neurochemistry and Neurophysiology 1986. A. B. Borkovec and Dale B. Gelman, Eds. Humana, Clifton, NJ, 1986. xii, 484 pp., illus. \$69.50. Experimental and Clinical Neuroscience. From a conference, College Park, MD, Aug. 1986.

The Machinery of Nature. Paul R. Ehrlich. Simon and Schuster, New York, 1987. 320 pp., illus. Paper, \$8.95. Reprint, 1986 edition.

Molecules of the Mind. The Brave New Science of Molecular Psychology. Jon Franklin. Atheneum, New York, 1987. xiv, 303 pp. \$18.95.

Multivariate Statistical Methods. A Primer. Bryan F. J. Manly. Chapman and Hall (Methuen), New York, 1986. x, 159 pp., illus. \$35; paper, \$15.95.

The Neglect of Experiment. Allan Franklin. Cambridge University Press, New York, 1986. xiv, 290 pp., illus. \$42.50.

Neurobehavioral Toxicology. Zoltman Annau, Ed. Johns Hopkins University Press, Baltimore, 1986. xiv, 443 pp., illus. \$79.50. Johns Hopkins Series in Environmental Toxicology.

Neurobiology of Taste and Smell. Thomas E. Finger and Wayne L. Silver, Eds. Wiley-Interscience, New York, 1987. xii, 449 pp., illus. \$69.95. Wiley Series in Neurobiology.

Neurobiology of the Control of Breathing. Curt von Euler and Hugo Lagercrantz, Eds. Raven, New York, 1986. xxii, 321 pp., illus. \$68. Karolinska Institute Nobel Conference Series. From a conference, Stockholm, 1985.

Organic Syntheses by Oxidation with Metal Compounds. W. J. Mijs and C. R. H. I. de Jonge, Eds. Plenum, New York, 1986. xviii, 908 pp., illus. \$115.

Organic Synthesis, Reactions and Mechanisms. B. Christoph *et al.* Springer-Verlag, New York, 1987. viii, 260 pp., illus. \$83.50. Topics in Current Chemistry, 137.

Organolithium Compounds/Solvated Electrons. N. M. Alpatova *et al.* Springer-Verlag, New York, 1987. vi, 226 pp., illus. \$74.50. Topics in Current Chemistry, 138.

The Origin and Domestication of Cultivated Plants. C. Barigozzi, Ed. Elsevier, New York, 1986. vi, 218 pp., illus. \$71. Developments in Agricultural and Managed-Forest Ecology 16. From a symposium, Rome, Nov. 1985.

Origins. A Skeptic's Guide to the Creation of Life on Earth. Robert Shapiro. Bantam, New York, 1987. 333 pp. Paper. \$12.95. Reprint, 1986 edition.

The Packaging of Power Semiconductor Devices. C. A. Neugebauer *et al.* Gordon and Breach, New York, 1986. viii, 86 pp., illus. \$25. Electrocomponent Science Monographs, vol. 7.

Particle Size Distribution. Assessment and Characterization. Theodore Provder, Ed. American Chemical Society, Washington, DC, 1987. x, 308 pp., illus. \$59.95. ACS Symposium Series, 332. Based on a symposium, Chicago, Sept. 1985.

Quantum Mechanical Tunneling and Its Applications. D. K. Roy. World Scientific, Singapore, 1986 (U.S. distributor, Taylor and Francis, Philadelphia). xii, 372 pp., illus. \$53.

Quantum Optics. Adam Kujawski and Maciej Lewenstein, Eds. Reidel, Dordrecht, 1986 (U.S. distributor, Kluwer, Norwell, MA). 324 pp., illus. \$69.50. From a school, Ustron, Poland, Sept. 1985.

Radiative Properties of Hot Dense Matter III. Balazs Rozsnyai *et al.*, Eds. World Scientific, Singapore, 1987 (U.S. distributor, Taylor and Francis, Philadelphia). x, 566 pp., illus. \$74. From a conference, Williamsburg, VA, Oct. 1985.

Radon and Its Decay Products. Occurrence, Properties, and Health Effects. Philip K. Hopke, Ed. American Chemical Society, Washington, DC, 1987. xii, 610 pp., illus. \$89.95. ACS Symposium Series, 331. Based on a meeting, New York, April 1986.

The Rat Brain in Stereotaxic Coordinates. George Paxinos and Charles Watson. 2nd ed. Academic Press, Orlando, FL, 1986. Unpagged. Spiral bound, \$50.

Stereoselective Synthesis. Mihaly Nogradi. VCH, New York, 1987. xiv, 356 pp., illus. \$93.

A Stochastic Maximum Principle for Optimal Control of Diffusions. U. G. Haussmann. Longman (Wiley), New York, 1986. vi, 109 pp. Paper, \$31.95. Pitman Research Notes in Mathematics Series, 151.

Stochastic Simulation. Brian D. Ripley. Wiley, New York, 1987. xiv, 237 pp., illus. \$32.95. Wiley Series in Probability and Mathematical Statistics.

The Strangelove Legacy. Children, Parents, and Teachers in the Nuclear Age. Phyllis La Farge. Harper and Row, New York, 1987. xii, 242 pp. \$15.95.

Structural Phase Transitions in Layered Transition Metal Compounds. Kazuko Morizuki, Ed. Reidel, Dordrecht, 1986 (U.S. distributor, Kluwer, Norwell, MA). x, 300 pp., illus. \$94.50. Physics and Chemistry of Materials with Low-Dimensional Structures, Series A, Layered Structures.

Structure, Dynamics and Function of Biomolecules. A. Ehrenberg *et al.*, Eds. Springer-Verlag, New York, 1987. xvi, 302 pp., illus. \$71.50. Springer Series in Biophysics, 1. From a workshop, Stockholm, July 1986.

Supersymmetry, Supergravity, Superstrings '86. B. de Wit, P. Fayet, and M. Grisaru, Eds. x, 565 pp., illus. \$67. From a school, Trieste, Italy, April 1986.
