Congressional Science and Engineering Fellowships 1990-91

PROGRAM: Fellows spend one year working as special assistants on the staffs of members of Congress or congressional committees, working in legislative areas requiring scientific and technical expertise. The program includes an orientation on congressional and executive branch operations and a year-long seminar program on issues involving science and public policy. Fellows receive stipends from their sponsoring societies.

PURPOSE: To provide a unique public policy learning experience, to demonstrate the value of science-government interaction, and to make practical contributions to the more effective use of scientific and technical knowledge in government.

CRITERIA: A prospective Fellow must be a postdoctoral to mid-career scientist or engineer; demonstrate exceptional competence in some area of science or engineering; be cognizant of many matters in nonscientific areas; demonstrate sensitivity toward political and social issues; and perhaps most important, have a strong interest and some experience in applying personal knowledge toward the solution of societal problems.

SPONSORS: Twenty-one national professional scientific and engineering societies sponsor or co-sponsor Congressional Science and Engineering Fellows:

Acoustical Society of America	American Society for Microbiology
American Association for the Advancement of Science	American Society of Plant Physiologists
American Chemical Society	American Society of Zoologists
American Geophysical Union	American Veterinary Medical Association
American Institute of Biological Sciences	Biophysical Society
American Institute of Physics	Engineering Society of Detroit
American Physical Society	Geological Society of America
American Psychological Association	Institute of Electrical and Electronics Engineers
American Society for Agronomy/ Crop Science Society of America/ Soil Science Society of America	National Society of Professional Engineers
American Society of Mechanical Engineers	Office of Technology Assessment
	Society for Research in Child Development

Applicants for these fellowships should apply directly to the appropriate professional society. Stipends, application procedures, timetables, and deadlines vary by society. For further information about the program, contact each society directly. A list of the societies, with mailing addresses and contact people, is available from:

**Congressional Science and Engineering Fellowship Program
American Association for the Advancement of Science
1333 H Street, NW, Washington, DC 20005**

Minorities and persons with disabilities are encouraged to apply.

5th Annual AAAS Forum for School Science

6-7 October 1989 ♦ Arlington, Va.

SCIENTIFIC LITERACY

Everybody's talking about it. It's scarce. Students aren't attaining it. What is it? Who needs it? How is it best attained? How is it adequately assessed?

FIND OUT AT THE 5TH ANNUAL AAAS FORUM FOR SCHOOL SCIENCE:

■ Join with nationally recognized leaders in education, government, business and the sciences to help develop a consensus definition of scientific literacy ■ Consider the implications of the meaning of scientific literacy for classroom practice and national policy ■ Learn about national projects — sponsored by AAAS, NAEP, NCISE, NSF, NSTA — aimed at achieving scientific literacy

SPEAKERS INCLUDE:

Bill Aldridge, Executive Director, National Science Teachers Association

Erwin Hiebert, Professor Emeritus, History of Science, Harvard University

Paul DeHart Hurd, Professor Emeritus, Science Education, Stanford University

Jon Miller, Director, Social Science Research Institute, Northern Illinois University

C.K.N. Patel, Executive Director, Research on Materials Science and Academic Affairs Division, AT&T Bell Labs

F. James Rutherford, Education Officer, American Association for the Advancement of Science

Bassam Shakhashiri, Assistant Director, Directorate for Science and Engineering Education, National Science Foundation

Thomas Spiro, Chemist, Princeton University

Iris Weiss, President, Horizon Research, Inc.

REGISTER NOW!

For program and registration information: Call (202) 326-6620 or write: Forum '89, Office of Science & Technology Education, AAAS, 1333 H Street, NW, Washington, DC 20005

We examine
the issues before
others even ask the
questions.

It's no surprise that a magazine published by MIT would cover the latest developments in technology and science.

But what is surprising is the magazine's jargon-free, hard-hitting examination of the current technological issues facing society. Issues that other science magazines simply gloss over, only to uncover them much later.

Technology Review. It's biotechnology. Superconductors. Space technology. Health care. Hazardous waste. Arms control. All the latest applications examined inside out.

While Technology Review won't necessarily be optimistic about the latest so-called "advances" in technology, you will find it authoritative and surprisingly controversial. Try a sample copy. We think you'll be surprised too.

Subscribe to **Technology Review** now and get the next year (8 issues) for just \$18. Save \$6 off the regular \$24 subscription price.

This Week in SCIENCE

Human genome project

THE game plan for the "human genome project" is to have a physical map of the genome—all of the genetic material present in human cells—in 5 years. The problem is to define exactly what a physical map is and how it should be constructed and to find ways to integrate into it data obtained with different techniques. In a Perspective, members of the National Research Council's Committee on the Mapping and Sequencing of the Human Genome present a proposal for defining a common language for and a common set of landmarks on the human genome (page 1434). The genome lingua franca would be sequence-tagged sites or STSs; data obtained through restriction mapping and contig mapping experiments would be converted into STSs. In a News feature, Roberts elaborates on the specifics of the proposal, on how the translations into STS nomenclature would work, and on the strengths of such an approach (page 1438).

Great Basin evolution

THE Great Basin is centered in Nevada and Utah and stretches into California and Idaho. It is an area rich in geologic clues about the earth's evolution. Using a combination of recent structural, stratigraphic, paleomagnetic, seismic, and borehole data, Levy and Christie-Blick have developed a new pre-Mesozoic palinspastic map—one focusing specifically on sedimentary rocks from the time interval between 1600 and 535 million years ago—for the eastern part of the Great Basin (page 1454); such a map (the name comes from the Greek for "stretched back") restores the region's outcrops to their original positions. Crustal shortening occurred from 150 to 50 million years ago whereas crustal extension was a more recent phenomenon, prominent in the past 37 million years; when the effects of crustal shortening (cover) and extension are removed, new interpretations of the geologic evolution of the

region before 245 million years ago become possible. Despite a number of uncertainties in parameters used in map construction, new insights have been gained about when and how the size, orientation, and shape of the region have changed over time.

Antarctic sponges and anchor ice

DURING the past three decades, there have been dramatic shifts in the densities of the Antarctic sponge *Homaxinella balfourensis* and its predators near McMurdo Sound (page 1484). The immediate cause of the population fluctuations is anchor ice, aggregated crystals of ice that form beneath the surface of the sea; the anchor ice damages and ultimately kills the sponges, and when it eventually breaks away it carries off the sponges with it. (Damage caused by anchor ice is easy to distinguish from damage caused by predators: the anchor ice discolors the flesh whereas the predators strip the flesh from the skeleton.) At times when sponges have been rare (in the 1960s and again around 1984), the anchor ice was thick; in contrast, in the early 1970s, there was little anchor ice, and population explosions of both sponges and their predators occurred. Dayton describes the changes that have occurred in sponge populations and speculates that the formation of anchor ice is a consequence of upwelling frigid water from deep in the sea, that this upwelling reflects shifts in regional currents, and that the current variations may be outcomes of large-scale and long-term oceanic and atmospheric phenomena.

Monocyte chemoattractant

TUMOR growth is affected by soluble substances that are secreted by infiltrating macrophages. Tumors recruit monocytes from the circulation, the monocytes mature into macrophages, and the powerful substances that the macrophages produce can ei-

ther stimulate or inhibit the tumor cells. What attracts the monocytes to the tumors are chemical substances that are related to or identical to chemoattractants released by normal muscle cells. Smooth muscle cells secrete the monocyte attractant called smooth muscle cell-derived chemotactic factor (SMC-CF); Graves *et al.* show that an SMC-CF-like protein, whose presence is correlated with a monocyte attractant activity, is secreted by a variety of tumors, including osteosarcomas, fibrosarcomas, melanomas, glioblastomas, and rhabdomyosarcomas (page 1490). Thus it appears that normal smooth muscle cells and various malignant cells use a similar mechanism for recruiting macrophages. The possibility is therefore raised that SMC-CF-like molecules could have a clinical role in the regulation of tumor growth.

Neurochemistry of satiation

CHOLECYSTOKININ (CCK) plays a pivotal role in inducing feelings of satiety after a meal (page 1509). Although earlier experiments had shown that injections of this neuropeptide induced satiety, it was unclear whether CCK present in the body is involved in the normal mechanism by which satiety is felt. However, with the availability of specific antagonists of CCK, Dourish *et al.* now confirm the importance of this substance for bringing about feelings of satisfaction after eating. Two antagonists were used, one that specifically blocked the receptors in the brain for CCK and one that blocked CCK receptors outside the brain. Brain receptors were found to exert the major influence on satiety: their antagonists were two orders of magnitude more potent than peripheral antagonists in blocking the onset of feelings of satiety and in increasing feeding. Because the sequelae of CCK action can now be altered, it may be possible to use agonists and antagonists of CCK as appetite suppressants and stimulants in a range of human eating disorders.

AIDS

Books from AAAS

AIDS 1988: AAAS Symposia Papers

Edited by Ruth Kulstad
Foreword by C. Everett Koop

This volume contains many of the groundbreaking papers on AIDS presented at the 1988 AAAS Annual Meeting.

The wide variety of the papers presented here reflects the current thinking about AIDS research today—that control over the AIDS epidemic must be achieved through a collaborative, multi-disciplinary effort that includes not only the medical and biological sciences, but the social and behavioral sciences as well.

This fully indexed volume is organized into five major sections: The first explores the epidemiology and natural history of AIDS and the HIV infection both in the United States and internationally. It also looks at the difficulty of predicting the course of the virus—statistical issues;

patterns of HIV-1 incubation, infectiousness, and transmission; and approaches to demographic impact modeling.

Section two discusses the social consequences of AIDS as they relate to gender, intravenous drug users, and public policy, and it examines the dilemmas that AIDS presents to the medical community.

The third section focuses on the AIDS prevention strategies currently employed around the world.

Section four considers the economic, political, ethical and legal issues surrounding the epidemic.

The final section presents several recent medical and biological studies on AIDS and HIV.

AIDS 1988 is a timely, authoritative source of information on the growing body of AIDS research being conducted around the world. It is essential for medical, biological, social, and behavioral scientists, and for everyone who is professionally or personally concerned about the AIDS epidemic.

1988; 478 pp.; softcover
index; 12 appendices
#88-19S – \$29.95 (members \$23.95)

AIDS: Papers from Science, 1982-1985

Edited by Ruth Kulstad

This collection includes frequently cited research papers and news reports on AIDS that were published in *Science* between August 1982 and September 1985.

Many of the papers relate directly to AIDS research, while others touch on relevant aspects of the immune system. The news stories help to explain the ongoing research, while focusing on some of the sociological questions raised by the disease. The book is arranged chronologically, enabling the reader to trace the his-

tory of the AIDS epidemic through September 1985—a history that is of great sociological interest.

This fully indexed collection is valuable not only for the experimental data and conclusions, but also as an excellent bibliographic reference of AIDS work in major journals worldwide.

1986; 654 pp.; softcover
detailed indexes and illustrations
#85-23S – \$19.95 (members \$15.95)

Hydrocarbon Energy Revisited

Many energy experts now project a continuation of relatively low prices for oil for much of the next decade. This would lead to a large increase in U.S. importation of oil and help OPEC eventually to resume ability to dictate high prices.

The facts and trends on which the current estimates are based seem solid. From 1969 to 1988 non-U.S., non-OPEC free world production increased fivefold. This, together with conservation and substitution induced by high prices for oil, led to a drop in sales by OPEC from 1979 to 1985 of almost 50%. To avoid a further loss of market share the price was drastically reduced by Saudi Arabia and others. The current level of prices has slowed exploration and drilling by non-OPEC countries, but with excess production capacity already in place, there is little likelihood of a substantial rise in world oil prices in the next several years, short of a major Mideast conflagration.

The effects of continuing low world oil prices on the complex U.S. energy system would be many and profound. Some of them are already apparent. Efforts in conservation, improved energy efficiency, and substitution of other fuels for oil have diminished. Exploration and drilling for hydrocarbons has dropped; production of petroleum has decreased; consumption of petroleum is increasing; imports of oil and its products have risen. Additional effects such as tightness in supplies of natural gas and price increases for that fuel will become apparent later. A possible future development is sharply expanded dependence on hydrocarbons for generation of electric power.

Before the early 1980s the contiguous continental United States had already become a mature petroleum province; costs of finding oil in it exceeded those of many countries. High prices for oil in the early 1980s led to extensive drilling here, but the current rate is only about a fifth of the peak. Unless substantial reserves are added, production capability diminishes with time. In 1985 production of crude oil plus condensate totaled 10.6 million barrels per day (Mbd). In 1988 it was 9.8 Mbd, and in 1989 it will be 9.3 Mbd. Experts predict that in the year 2000 it will be 6 Mbd.

Consumption of petroleum increased an average of 3.3% per year between 1985 and 1988 (17 Mbd of products in 1988). Experts predict that demand will continue to increase, but at the rate of only 1.0 to 1.5% per year. This slow rate prediction could be an underestimate.

In 1985, while high prices still prevailed, net imports of oil and its products were 4.3 Mbd. In 1988 they were 6.6 Mbd. During 1989 they will be about 7.2 Mbd. A recently released CONOCO report, "World Energy Outlook Through 2000," projects imports of 11 Mbd in the year 2000. The estimate is based on the assumption that use of oil will increase at the slow rate.

For many purposes oil and natural gas are interchangeable as fuels. This is particularly true in industrial applications and when they are used in power generation. Many of the large consumers can easily switch back and forth. When oil is cheap, the price for natural gas is depressed and drilling for gas is curtailed. Already, producible reserves of natural gas have diminished. When cheap natural gas is no longer available, it will be supplanted by oil.

Demand for hydrocarbons by the electrical utilities could lead to substantially enhanced importation of oil during the next decade. In the past, most of the base load generating plants have been fueled by coal; nuclear energy now contributes about 20% of electric power. However, only a few nuclear and coal plants are under construction. If demand for electricity continues to grow at a rate approaching that experienced in 1987 and 1988, the United States is headed for large shortages of base load capacity. Construction of coal and nuclear plants is costly and requires many years. In contrast, combined cycle plants fueled by natural gas or oil can be put into operation quickly and at low capital cost. Apparently many of the utilities are planning to pursue this course. But it is a course that would increase imports of oil further.

Substantial increases in importation of oil by the United States, Southeast Asia, and the less developed countries could restore control of the market to OPEC by the year 2000 or before. Unless there are economic incentives for improving energy efficiency, conservation, and substitution and for increasing domestic supplies, the United States will become increasingly vulnerable to a great, multicomponent energy crisis.—PHILIP H. ABELSON

through the ILP have differed in no way from the interactions I had when I served for 13 months as a liaison scientist with the U.S. Office of Naval Research-Tokyo in 1984-1985. How can Congress praise that program as a model of international scientific interaction, yet condemn the interaction when I do the same thing as an MIT faculty member through the ILP?

THOMAS W. EAGAR
Department of Materials Science
and Engineering,

Animal Experimentation: Context of a Quote

My attention has been called to a letter by Brandon P. Reines (11 Aug., p. 583) citing a statement of mine that seems to align me with the antivivisection movement.

I did publish an article in 1979 (1), giving a history of the development of our knowledge of hepatitis and pointing out how much was learned by clinical observation alone. Reines plucked out these words: "progress by the study of man is by no means unusual, in fact, it is more nearly the rule." Of course I stand by that, but its use in the context of his letter is a distortion of my belief and my practice. As I said in

another section of the same article, clinical observations may provide leads and these may need to be pursued by disciplines other than pure clinical observation. Most of the research I have engaged in over the past half century has involved use of experimental animals (mice, rats and rabbits).

PAUL B. BEESON
21013 Northeast 122nd Street,
Redmond, WA 98053

REFERENCE

1. P. B. Beeson, *Am. J. Med.* **67**, 366 (1979).

Erratum: In the legend of figure 3 (p. 1437) in the Research Article "Synthetic amphiphilic peptide models for protein ion channels" by J. D. Lear *et al.* (27 May 1988, p. 1177), the holding potential for the (LSLLSL)₃ peptide should have read, "−150 mV" instead of "−120 mV." In the same legend, the duration intervals of the plots in C, E, and F should have been given as 20 msec, 0.5 msec, and 20 msec, respectively.

Erratum: In the legend of figure 4 in the Research Article "Identification of the cystic fibrosis gene: Cloning and characterization of complementary DNA" by J. R. Riordan *et al.* (8 Sept., p. 1066), the oligonucleotide sequence "5'-GTTTCCTGGATTATGCCTGGGCAC-3'" [error is italicized] should have read "5'-GTTTCC-TGGATTATGCCTGGGCAC-3'"; one extra G residue was inserted in error. The same error appeared in note 35 (p. 1079) of the Research Article "Identification of the cystic fibrosis gene: Genetic analysis" by B. Kerem *et al.* (8 Sept., p. 1073). In addition, the first amino acid residue displayed in figure 2 of the paper by Kerem *et al.* should have been K (for lysine) instead of L; the N and the CF(ΔF) sequences were also mislabeled. The correct sequence should have read, "KENIIFGV" for N and "KENIIGV" for CF(ΔF).

NASA and Intellectual Quality

I was appalled to read in the 18 August issue of *Science* (Research News, p. 699) a statement, attributed to unnamed members of the astronomical community, that the intellectual quality at NASA centers is "mediocre at best." If these unnamed astronomers have the courage to identify themselves, I will personally invite them to visit the NASA-Ames Research Center to explain their point of view in face-to-face discussions with our outstanding scientific staff. We would point out in these discussions

Fourth Annual AAAS Arms Control Colloquium Science and Security Technology Advances and the Arms Control Agenda

November 16-17, 1989
Capital Hilton Hotel • Washington, DC

Sessions on:

U.S.-Soviet Relations • Conventional and Theatre Nuclear Forces in Europe • The U.S. Strategic Triad • The Future of SDI • Proliferation of Ballistic Missiles • Control of Chemical Weapons

Speakers include:

Congressman Les Aspin • Alexei Arbatov • Alexander Kononov • Randall Forsberg • Sheila Buckley • Matthew Meselson • Horst Telchik

For more information, write:

Raymond Orkwis, AAAS Arms Control Colloquium
American Association for the Advancement of
Science, 1333 H Street, NW
Washington, DC 20005
(202) 326-6490

EUROPEAN INSTITUTE of TECHNOLOGY

INVITATION FOR RESEARCH PROPOSALS

THE EUROPEAN INSTITUTE OF TECHNOLOGY invites research proposals to be funded in 1990.

The European Institute of Technology is an industrial consortium for research and higher education, organized by several leading international corporations. It seeks to strengthen innovation in Europe by increasing the effectiveness of industrial and university research and by forging a stronger industry-university partnership.

In 1989, the initial year of the EIT programme, 34 preliminary proposals from universities and institutes throughout Europe were chosen for Phase I funding. Following their elaboration and evaluation, the EIT announced on 4 July 1989 that nine had been selected for Phase II funding, representing a total of four million ECU.

In 1990, the EIT will fund research in the areas of information technology, materials technology and biotechnology/pharmacology. Researchers at European universities are invited to submit brief initial proposals for original research in any of these areas. The proposals will be reviewed by referees and panels of experts and some will be selected for further elaboration, with Phase I funding of ECU 5 000 to 10 000. A few of the resulting detailed proposals will then be selected for Phase II funding of as much as ECU 250 000 annually for three years.

Initial proposals should be submitted by 15th November 1989. Instructions for preparing the proposals can be obtained from:

European Institute of Technology
Palazzo Diamanti - Via Noris 1 - 37121 Verona (Italy)
Telephone: +39-45-800 6433 - Telefax: +39-45-800 1225

Information for Contributors

THE EDITORS OF *SCIENCE*

Manuscripts should be addressed to the Editor, *Science*, 1333 H Street, NW, Washington, DC 20005. Submit three copies together with a letter of transmittal giving

1) the names and telephone numbers of the authors;

2) the title of the paper and a statement of its main point;

3) three to eight keywords to be used for indexing;

4) the names, addresses, telephone numbers, and fields of interest of four to six persons outside your institution who are qualified to referee the paper;

5) the names of colleagues who have reviewed the paper;

6) the total number of words (including text, references, and figure and table legends) in the manuscript; and

7) a statement that the material has not been published and is not under consideration for publication elsewhere.

In addition, include with your manuscript:

(i) any paper of yours that is in press or under consideration elsewhere and includes information that would be helpful in evaluating the work submitted to *Science*;

(ii) written permission from any author whose work is cited as a personal communication, unpublished work, or work in press but is not an author of your manuscript;

(iii) for review of manuscripts based on crystallographic data, two copies of the coordinates;

(iv) the databank identifier codes for sequence or coordinate data.

It is assumed that all those listed as authors of a work have agreed to be so listed, have seen and approved the manuscript, and are responsible for its content.

Before being reviewed in depth, most papers are rated for their interest and overall suitability by a member of the Board of Reviewing Editors. Papers submitted in disciplines for which there is no appropriate member of the Board of Reviewing Editors may be screened by editorial staff members in consultation with outside experts. Papers that are not highly rated are returned to the authors within about 2 weeks; the title page and abstract from one copy are retained for our files. The others are reviewed in depth

by two or more outside referees. Authors are notified of acceptance, rejection, or need for revision, usually within 6 to 10 weeks. Papers cannot be resubmitted, either after initial screening or after in-depth review.

Conditions of Acceptance

When a paper is accepted for publication in *Science*, it is understood by the editors that (i) any materials and methods necessary to verify the conclusions of the experiments reported will be made available to other investigators under appropriate conditions; (ii) sequence and crystallographic data will be offered for deposit to the appropriate data bank and the identifier code will be sent to *Science*; and (iii) the paper will remain a privileged document and will not be released to the press or the public before publication. If there is a need in exceptional cases to publicize data in advance of publication, the AAAS Office of Communications (202-326-6440) must be consulted.

Selection of Manuscripts

In selecting papers for publication, the editors give preference to those of general significance that are well written, well organized, and intelligible to scientists in different disciplines. An attempt is made to balance the subject matter in all sections of *Science*. Membership in the AAAS is not a factor in selection.

Accepted papers are edited to improve the accuracy and effectiveness of communication and to bring them within the specified length limits. When the author's meaning is not clear, the editor may consult the author by telephone; when editing is extensive, the manuscript may be returned for approval and retyping before the type is set.

Categories of signed papers include: general articles, research articles, reports, letters, technical comments, book and software reviews, perspectives, and policy forums.

General Articles. General articles (up to 5000 words) are expected to (i) review new developments in one field that will be of interest to readers in other fields; (ii) de-

scribe a current research problem or a technique of interdisciplinary significance; or (iii) discuss some aspect of the history, logic, policy, or administration of science. Readers should be able to learn from a general article what has been firmly established and what are unresolved questions; speculation should be kept to a minimum.

Many of the general articles are solicited by the editor, but unsolicited articles are welcome. Both solicited and unsolicited articles undergo review.

General articles should include a note giving the authors' names, titles, and addresses; a summary (50 to 100 words); an introduction that outlines for the general reader the main point of the article; and brief subheadings to indicate the main ideas. The reference list should not be exhaustive; a maximum of 50 references is suggested. Figures and tables should occupy no more than one printed page.

Research Articles. A research article (up to 4000 words) is expected to contain new data representing a major breakthrough in its field. The article should include an author note, abstract, introduction, and sections with brief sideheads. A maximum of 40 references is suggested. Figures and tables together should occupy no more than one printed page.

Reports. Reports (up to 2000 words) are expected to contain important research results. They should include an abstract (no more than 100 words) and an introductory paragraph. A maximum of 30 references is suggested. Figures and tables together with their legends should occupy no more than one printed page.

Letters. Letters are selected for their pertinence to material published in *Science* or because they discuss problems of general interest to scientists. Letters pertaining to material published in *Science* may correct errors; provide support or agreement; or offer different points of view, clarifications, or additional information. Personal remarks about another author are inappropriate. Letters may be reviewed by outside consultants. Letters selected for publication are intended to reflect the range of opinions received. The author of the paper in question is usually given an opportunity to reply.

All letters are acknowledged by postcard; authors are notified if their letters are to be published. Preference is given to letters that do not exceed 250 words. Letters accepted for publication are frequently edited and shortened in consultation with the author.

Technical Comments. Technical comments (up to 500 words) may criticize articles or reports published in *Science* within the previous 6 months or may offer useful additional information. Minor issues should

be resolved by private correspondence. The authors of the original paper are asked for an opinion of the comment and are given an opportunity to reply in the same issue if the comment is published. The comments, and sometimes the reply, are subject to the usual review procedures. Priority disputes undergo extensive review and are published only when action is recommended.

Book and Software Reviews. The selection of books and software packages to be reviewed and of reviewers is made by the editors. Instructions and length specifications accompany items to be reviewed when they are sent to reviewers.

Manuscript Preparation

Typing. Use double-spacing throughout the text, tables, figure legends, and references and notes and leave margins of at least 2.5 centimeters. Put your name on each page and number the pages starting with the title page.

Titles. Titles should be short, specific, and amenable to indexing. For general articles the maximum length is 80 characters and spaces; for research articles and reports the maximum is 100 characters.

Summaries or abstracts. These should include a sentence or two explaining to the general reader why the research was undertaken and why the results should be viewed as important. The abstract should convey the main point of the paper and outline the results or conclusions.

Text. A brief introduction should indicate the broad significance of the paper. The whole text should be intelligible to readers in different disciplines. Technical terms should be defined. All tables and figures should be cited in the text in numerical order.

Symbols and abbreviations. Define all symbols, abbreviations, and acronyms.

Units of measure. Use metric units. If measurements were made in English units, give metric equivalents.

References and notes. Number references and notes in the order in which they are cited, first through the text and then through the table and figure legends. List a

reference only one time. References that are *always* cited together may be grouped under a single number. Use conventional abbreviations for well-known journals; provide complete titles for other journals. For references with up to five authors provide all the names; for more than five, provide the name of the first author only. See issues of the journal for examples.

Unpublished observations. Reference to unpublished data should be given a number in the text and placed, in correct sequence, in the references and notes.

Acknowledgments. Gather all acknowledgments into a brief statement at the end of the references and notes.

Informed consent. Investigations on human subjects must include a statement indicating that informed consent was obtained after the nature and possible consequences of the studies had been fully explained.

Animal welfare. Authors using experimental animals must state that their care was in accordance with institutional guidelines. For animals subjected to invasive procedures, the anesthetic, analgesic, and tranquilizing agents used, as well as the amounts and frequency of administration, must be stated.

Figures. For each figure submit three high-quality glossy prints or original drawings of sufficient size to permit relettering but not larger than 22 by 28 centimeters (8½ by 11 inches). On the back of every figure write the first author's name and the figure number and indicate the correct orientation. *Manuscripts with oversized figures will be returned to the author without review.* Photocopies of figures are not acceptable; transparencies, slides, or negatives cannot be used because they cannot be sent to reviewers.

On acceptance of a paper, authors requesting the use of color will be asked to supply slides or negatives of the color artwork and to pay \$600 for the first color figure or figure part and \$300 for each additional figure or figure part to help defray the cost of obtaining color separations.

Illustrations reprinted from other publications must be credited. It is the author's responsibility to obtain permission to re-

print such illustrations in *Science*.

Tables. Tables should supplement, not duplicate, the text. They should be numbered consecutively with respect to their citation in the text. Each table should be typed, with its legend (double-spaced), on a separate sheet. Give each column a heading with units of measure indicated in parentheses. Do not change the unit of measure within a column.

Equations and formulas. Use quadruple-spacing around equations and formulas that are to be set off from the text. Define all symbols.

Uncertainties and reproducibility. Evidence that the results are reproducible and the conditions under which this reproducibility (replication) was obtained should be explicitly stated. The effect of limitations in experimental conditions on generalizability of results should be discussed. Uncertainties should be stated in terms of variation expected in independent repetitions of the experiments; they should include an allowance for possible systematic error arising from inadequacies in the assumed model and other known sources of possible bias. Probabilities from statistical tests of significance should be subordinated to the reporting of results and associated uncertainties.

Printing and Publication

Proofs and reprints. One set of galley proofs is sent to the authors. An order blank for reprints accompanies the proofs.

Scheduling. Papers are scheduled for publication after *Science* has received corrected galley proofs from the authors. Papers with tables or figures that present problems in layout, or with color figures or cover pictures, or that exceed the length limits may be subject to delay.

Cover Photographs

Particularly good photographs that pertain to a paper being submitted will be considered for use on the cover. Submit prints (not slides, negatives, or transparencies) with the manuscript.
