VOL. 246 ■ PAGES 181-296

# The most advanced of the species thinks just like you.

## Introducing L and XL Ultracentrifuges, the Optima™ Series.

They're here. A whole new class of ultracentrifuges. The Optima™ L and XL.

Like you, these new ultracentrifuges can solve complex problems in seconds. The XL even has ESP,™ an Efficient Sedimentation Program to optimize conditions for the fastest separations possible.

But brains aren't everything. Our body is designed to be sensi-

tive to the world, and to you. The L and XL use no chlorofluorocarbons. For more comfort in your lab, they have only 1/3 the heat output of other models. And the drive is so stress-tolerant, you don't need to weigh samples anymore.

When you look at the entire species *ultracentrifuge*, the L and XL Optima Series is by far the most advanced.

**If keeping up with the latest in cell biology is tough for experts, imagine how it makes newcomers feel.**

No matter how much you know, there's always more to learn. Particularly in cell biology, a science whose rapid and continual evolution could make even the most experienced life scientist feel like a beginner.

Today's cell biology techniques and tools present researchers with unprecedented opportunities. Tomorrow's promise even more. But few investigators will have the time and resources to test every product, master every procedure, and explore every new possibility of this emerging, highly interdisciplinary science.

That's why Life Technologies has formed a dedicated group wholly committed to your success in cell biology research, whether you're an experienced cell biologist or a newcomer to the field.

We're going to help you keep pace. We'll do it by developing a comprehensive line of innovative, reliable, state-of-the-art GIBCO BRL products. By monitoring advances in the field, turning complex, new technologies into user-friendly tools. By providing you with clear, step-by-step guides to applications and protocols. And by giving you instant, Tech-Line<sup>SM</sup> access to guidance from our cell biology specialists.

The first GIBCO BRL cell biology products are now available for applications in transmembrane signaling, regulation of gene expression, extracellular information transfer and cell isolation/separation. Products for other applications will be available in the near future.

To learn more, call your GIBCO BRL representative or our toll-free Tech-Line<sup>SM</sup>, (800) 638-4045 today. If you're new to cell biology, we'll make you an expert. If you're an expert, we'll make you a winner.

These products are for research use only. Not for diagnostic or therapeutic use in humans or animals. Tech-Line<sup>SM</sup> is a service mark of Life Technologies, Inc.

## This Week in SCIENCE

### Lectin-sugar interactions

**L**ECTINS are proteins that bind noncovalently but specifically to carbohydrates. The name lectin comes from the Latin word *legere*, which means to choose: different lectins “choose” to bind to different carbohydrates. Studies of lectins have been carried out in numerous systems—viruses, bacteria, protozoa, slime molds, plants, and higher animals. They were first identified in plants but are now thought to be ubiquitous in living organisms; mounting evidence suggests that they are crucial to cell-cell recognition. Sharon and Lis review lectin research and discuss insights that have been gained regarding cell-cell recognition in various normal and aberrant states, including normal organ and tissue differentiation and growth, normal migration of cells throughout the body, pathogen and host interactions, and metastatic growth of malignant tumors (page 227). Lectins may work alone or in concert with other recognition molecules to bring about recognition, but, in either case, interventions in lectin-carbohydrate interactions could be effective in blocking infections and other pathologic processes.

### Silicon microphysiometer

**A** tiny biosensor can detect biochemical changes taking place in as few as 1000 cells in 100 nanoliters of fluid (page 243). As the sensitivity of this microtechnology grows, fewer and fewer cells will be needed; eventually it may even be possible to measure biochemical changes in single cells. Cells are placed in a flow chamber and bathed in a physiologic solution; the silicon biosensor measures how the acidity of the solution changes (cover). The solution becomes more acid when two breakdown products, lactic acid and carbon dioxide, are generated inside cells, and acidity thus provides a measure of the cell's catabolic rate. Parce *et al.* illustrate the use of the device on a variety of coupled stimuli and cells—a metabolic inhibitor acting

on a macrophage cell line, epidermal growth factor acting on normal epidermal cells, chemotherapeutic drugs acting on tumor cells, irritants acting on cells of the eye, and antiviral agents acting on viruses that are infecting host cells. It is clear that this biosensor will be an important adjunct to standard *in vitro* and *in vivo* assays for the rapid screening of drugs and toxic substances that may, in subtle or dramatic ways, alter cellular biochemistry.

### Fungal pathogenicity

**P**LANTS produce toxic compounds called phytoalexins that help to protect them from dangerous pathogens. For example, pea plants make a phytoalexin called pisatin that counters some of the effects of infecting fungi. However, some infectious fungi fight back with a protein—pisatin demethylase—that degrades pisatin to a less toxic substance. Schäfer *et al.* investigated what happens when pisatin demethylase is produced by fungi that normally are not pathogenic for peas (page 247). The gene for pisatin demethylase was transferred into and expressed in a fungal pathogen of maize and into another fungus that normally lives on decaying organic matter. The first became pathogenic for the pea plants; the second did not. The pathogenicity of the first fungus for its normal maize host was not enhanced by the introduction of the pisatin demethylase. The pisatin demethylase gene appears therefore to be a necessary but not a sufficient gene for making a fungus pathogenic for peas.

### Interleukin-1 action

**I**NTERLEUKIN-2 is secreted by T lymphoid cells; its production precedes the proliferation of T cells, a crucial step in effective immune responses. Two known separate external signals are required for the induction of interleukin-2: one is the binding of an antigen or a lectin to the T cell receptor on the cell surface and the other is the

binding of interleukin-1 to a high affinity interleukin-1 receptor. Muegge *et al.* have studied what happens in the nucleus after these inducers have acted at the surface (page 249). Lectin binding induces production of messenger RNA for the *c-fos* protein; interleukin-1 induces messenger RNA for *c-jun*; when the *c-fos* and *c-jun* proteins combine they form the AP-1 factor. This factor attaches to the AP-1 site in the promoter region of the interleukin-2 gene, contributing to the production of interleukin-2. There are many cell types that respond to interleukin-1, and it may be through AP-1 that interleukin-1 induces the pleiotropic effects in inflammation and immunity for which it is known.

### Hazard for fumigators

**G**RAIN supplies, which can be destroyed by insects and microorganisms, are routinely and repeatedly fumigated. Otherwise, crop deterioration and destruction may occur not only while the grains are still in the field but also while they are being transported from field to storage bins, while they are being held in storage bins, and while they are later transported out of storage and processed. Among the most commonly used fumigants are phosphines, which are poisonous flammable gases that smell like garlic. Aluminum phosphide and magnesium phosphide are applied to the grains in pellets; phosphine gas is generated in a timed-release fashion (and as quickly as within 5 minutes) that is dependent on temperature and humidity. Garry *et al.* report that exposure to phosphines alters the chromosomes of workers who apply them (page 251). Workers in Minnesota were studied both at the time of phosphine exposure and some months later, when the fumigation “season” had ended. Sizable numbers of lasting chromosome rearrangements were detected in circulating lymphoid cells. Whether these changes presage development of specific malignancies or deficiency diseases in these individuals remains to be seen.

**Immediate Shipment Guaranteed!**

# Gilson fraction collectors have always been reliable. Our newest offers 98% problem-free performance.

Whether you need simple or sophisticated collection techniques, the one thing you need is a collector that performs day-in and day-out. Without jamming. Without breaking down. That's the kind of reliability built into every Gilson fraction collector... from the very first in 1957 to the very latest introduced in 1986.

## **Stationary rack system is one of our secrets to problem-free performance.**

Many collectors have rotating carousel racks. Some of our earliest models did, too. But we soon recognized the advantages of a stationary rack. With fewer moving parts, the chance of mechanical problems is greatly reduced. The FC 203, since its introduction three years ago, has achieved a problem-free performance record of 98%. The stationary rack system is just one of the reasons why.

## **Built for long-term use... inside and out.**

To assure optimal performance over time, internal drive components are designed for long-term use—even in the cold room. Critical components are metal, rather than plastic, for long-lasting operation.

And, the exteriors of Gilson fraction collectors are durable, too. For example, the FC 203 features a chemically-resistant molded case and keypad to protect the unit inside and out from spills.

SB-1,  
introduced  
1958

SC-Escargot,  
introduced  
1967

FC-220 Racetrack,  
introduced 1972

## **Day-in and day-out convenience, too.**

We also build Gilson fraction collectors for easy installation and use. It starts with compact design. The 202 has the largest capacity of any collector—540 tubes. Yet, it measures only 20 inches wide by 17 inches deep. And the FC 203 takes up only about a square foot of bench space.

Gilson fraction collectors can be used with any HPLC or LC system—ours or other manufacturers'. And three of the collectors can control peripherals such as pumps and chart recorders.

## **Choose from five different models:**

**FC 80 and FC100 micro-fractionators:** Proven performers for simple time and drop collection. Many of these units have been in use for more than 15 years. Racks hold 80 or 100 tubes.  
**FC 203:** Collects fractions by time or drop for simple analyses; peak and time windows enable more sophisticated applications. An affordable multi-mode unit capable of collecting up to 128 fractions.

**201 and 202:** With 15 operating modes, 15 rack options and capacities up to 540 tubes, no other fraction collector does more or handles more.

## **Contact us for free literature today.**

To learn more about Gilson fraction collectors and how they outperform others, simply mark the reader service number below. Or call us toll-free in the U.S. at 800-445-7667.

## Sequences and Consequences of the Human Genome

The sequencing of the human genome involves big money, big consequences, and big controversies. Within the scientific community there is the question of money because of the "big science" image. The cost of the genome project (\$3 billion in 15 years) is much smaller than the cost of a supercollider or of a space station, and it is more of a mom-and-pop store enterprise than the mass production assembly line of real big science. The Cystic Fibrosis Foundation has spent \$120 million in the past 4 years on one illness, to say nothing of the other foundation and federal money spent on the same project. In that context a price of \$200 million per year, the figure for the human genome project, for work that applies to many diseases and untold discoveries in biology sounds cost-effective.

The benefits to science of the genome project are clear. Illnesses such as manic depression, Alzheimer's, schizophrenia, and heart disease are probably all multigenic and even more difficult to unravel than cystic fibrosis. Yet these diseases are at the root of many current societal problems. The costs of mental illness, the difficult civil liberties problems they cause, the pain to the individual, all cry out for an early solution that involves prevention, not caretaking. To continue the current warehousing or neglect of these people, many of whom are in the ranks of the homeless, is the equivalent of providing iron lungs to polio victims at the expense of working on a vaccine.

Other medical applications of a genome sequence include an early warning system that may help individuals predisposed to diseases such as alcoholism, colon cancer, and depression. The early warning may allow them to avoid the problems by behavior or diet modification or frequent medical checkups. Family planning also will be made more accurate. No individual should be forced to obtain genetic information but none should be denied information either.

The "sky is falling" group, who denounce the genome project, sound like they are paraphrasing a Woody Allen admonition by saying, "We stand at the crossroads. One road leads to hopelessness, the other to utter despair. We must have the courage to make the right decision." The potential risks from the new knowledge gained by sequencing the human genome appear, on close examination, to be old problems revisited. Genetic counseling already exists for Down syndrome, Tay Sachs, and sickle cell anemia. Personal insurance policies already ask for lung x-rays, heart condition tests, and information on such behaviors as smoking. Group insurance is available without test. Fingerprints are not required of the general population but are kept on file for those who commit a crime. The information in the genome adds accuracy and scope to many of these applications but no new or threatening principles. If the higher visibility of the genome project causes a qualitative change, then, of course, new procedures may be needed.

A genome sequence should not be a precondition of employment, and legislation might be needed if that problem were to arise. However, less accurate data of the same type would be available today from family histories, and that does not seem to be part of current employment forms. If more accurate information provides temptation for abuse, action will be needed.

The argument that dictators would alter genes to convert their enemies is farfetched. The idea that a Hitler or a Stalin would prefer the engineering of Jews into Aryans or capitalists into communists as cheaper or more satisfying than killing them (as they did) is absurd. We must be vigilant about ethical concerns but not paralyzed by outlandish scenarios.

The belief of biologists that studying simple organisms such as *Escherichia coli*, flies, and rats is relevant to human physiology and behavior has been brilliantly confirmed. But there are differences. One cannot extrapolate carcinogenic potency from the mouse to the rat with precision, and even less to the human. Some diseases involve speech and mental states unique to man. Sequencing the human genome puts us on the threshold of great new benefits and some real but avoidable risks. There are immoralities of commission that we must avoid. But there is also the immorality of omission—the failure to apply a great new technology to aid the poor, the infirm, and the underprivileged. We must step boldly and confidently across the threshold.—DANIEL E. KOSHLAND, JR.

## Nucleic acid analysis

**Sample:** Hae III Digest of  $\phi$ X  
**Column:** Gen-Pak<sup>®</sup> FAX (4.6mm x 100mm)  
**Detection:** UV at 260nm  
**Eluent A:** 100mM Tris/Cl, pH8.0, 1mM EDTA

# Essentials in bioresearch.

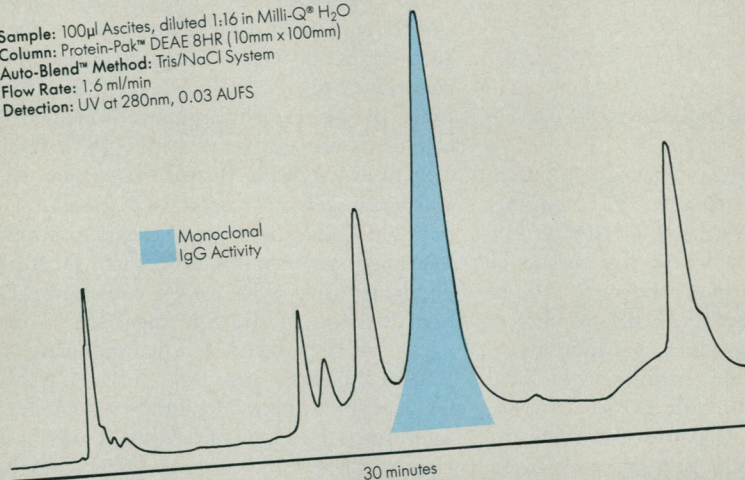

## Peptide scale-up

Sample: 300mg Crude Hexadecapeptide  
Column: Delta-Pak™ C<sub>18</sub>, 15μ, 300Å, (50mm x 300mm)  
Buffer A: 0.1% TFA/H<sub>2</sub>O  
Buffer B: 0.1% TFA/CH<sub>3</sub>CN  
Gradient: 0-25%B, 30 minutes, curve 6  
Flow Rate: 80ml/min.  
Detection: UV at 214nm

## Protein purification

Sample: 100μl Ascites, diluted 1:16 in Milli-Q® H<sub>2</sub>O  
Column: Protein-Pak™ DEAE 8HR (10mm x 100mm)  
Auto-Blend™ Method: Tris/NaCl System  
Flow Rate: 1.6 ml/min  
Detection: UV at 280nm, 0.03 AUFS

Whether your bioresearch involves isolation, characterization, compositional analysis, or quantitation of natural or synthetic compounds, high performance instrumentation, chemistry and technical expertise are absolutely essential to your success. Waters is the only company that can provide *all* of these essentials for your bioresearch—no matter where your research takes you now...and in the future.

**Bio-instrumentation.** Each high performance system is optimally configured for your biomolecule specific separation scheme. No other company offers such a wide range of high performance options in pump technology, sample injection, high sensitivity detection and data handling that provide exactly what your bioresearch needs.

**Bio-chemistries.** A choice of scalable chemistries, particle sizes, and column geometries in cartridge, glass or steel provide a single source to accommodate any biomolecule separation technique, from microbore analysis to process scale purification.

**Bio-expertise.** Waters reputation for knowledgeable and timely application support is well known. We stay with you until you are successful. Guaranteed.

Only Waters provides all the essentials necessary for your bioresearch. Ask for our complete bioseparations catalogue of instrumentation, chemistries and applications. Circle the reply number or call us at (508) 478-2000, ext. 2777.

sage as is the ICBM force, should one be issued, and may even receive it before the ICBM force does. It is true that, in order to enhance survivability, communication to the SSBN force is not two-way. However, as long as one-way communication is reliable, which can be demonstrated, the need to spend the money that would be necessary to obtain secure two-way communication is not obvious today. Finally, while Deutch asserts that there are "doctrinal" reasons for not relying on Trident, he does not tell us what these might be.

Third, there is citation of the dreaded "ASW [antisubmarine warfare] breakthrough." No one can prove that such a breakthrough will not occur. The Navy does, however, maintain an extensive program designed to ensure the security of its SSBNs. This program is subject to comprehensive, national-level oversight. The oversight groups agree that there is no danger of such a breakthrough in the foreseeable future. Furthermore, even if there were to be a breakthrough in detection, the problems inherent in turning detection into kill would remain nontrivial. In this context, it might be pointed out that, while the air is certainly

at least as transparent as the ocean, few people have cited this transparency as a bar to the survivability of mobile ICBMs.

In the end, the real role of ICBMs would appear to be, in the words of Brent Scowcroft and R. James Woolsey (1), to "augment" the Trident force. The most important question about ICBM modernization, then, and one that Deutch does not ask, let alone answer, is just how large and powerful such an augmentation needs to be and just how much survivability is affordable for it given this role?

MICHAEL F. ALTFELD  
Strategic and Theater Nuclear  
Warfare Division,  
Department of the Navy,  
Washington, DC 20350-2000

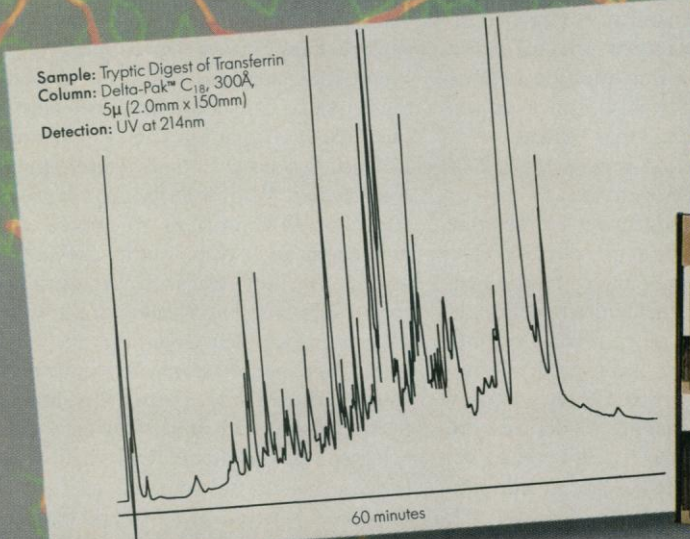

#### REFERENCES

1. B. Scowcroft and R. J. Woolsey, in *American Agenda: Report to the Forty-First President of the United States of America* (Washington, DC, 1988).

Deutch argues that land-based missiles need to be modernized for three reasons: (i) as a hedge against a possible Soviet antisubmarine warfare (ASW) breakthrough, (ii) because ICBMs remain the most controlla-

ble part of the triad for prompt and selective nuclear response, and (iii) to show "our allies and adversaries that the United States still possesses the political resolve to field a weapons system that . . . is considered a principal measure of deterrence and political military might." Having looked at the ASW problem in some detail, we remain unconvinced of the likelihood of a breakthrough by the mere statement of the possibility. The difference in promptness between submarine-launched ballistic missiles (SLBMs) and ICBMs is not significant. The "selective nuclear response" argument has some validity, not because of "a host of technical and doctrinal reasons," but simply because it would require launching individual missiles, which could potentially compromise a ballistic missile submarine's location. While this is indeed a problem, it is not insoluble. If land-based ICBMs are to have a role in the future, it will likely be related to this suggestion of selective nuclear response. The demonstration argument is unconscionable given the high cost of the suggested Midgetman system and current fiscal constraints.

In general, we found the article a valuable contribution, particularly for its discussion

## Essentials in peptide mapping.

Waters new 625 non-metallic, low dispersion LC system with microbore Delta-Pak™ reverse phase columns are essentials for high resolution peptide mapping. Isolate tens of picomoles of peptides in fraction volumes of less than 100μl prior to sequencing or compositional analysis. Use high resolution peptide maps to fingerprint complex samples. A choice of high sensitivity UV/Vis or photodiode array detectors plus the convenience of PowerLine™ single-point system control and unique 625 system features designed specifically for the biochemist provide LC performance never before available.

University of Delft in The Netherlands.

In the insert "Can Europe survive on chips?" Dickson calls the "mega-project" of Philips and the German companies a "mega-flop" because, soon after it started, "Siemens decided it would be cheaper to buy the chips off the shelf from Japan." The aim of the "mega-project," which began in 1984, was to develop submicron technology. A 4-megabit DRAM (Siemens) and a 1-megabit SRAM (Philips) were used as "vehicles"—the first commercial targets—to be on the market by 1989. It was anticipated that by that time the main competitors would have reached that stage. Philips and Siemens were minor producers of MOS VLSI memories (Philips being an important supplier of bipolar memories), but they both had to take a large leap forward in a comparatively short time.

From a technological standpoint, the "mega-project" is already a success. Of course there is still the problem of building up a strong market position. Siemens, therefore, bought Japanese technology—not chips—in order to produce 1-megabit DRAMS without overloading its own development program. [Philips chose to devel-

op additional products like 64K and 256K SRAMS, as well as a version of the latter using submicron ("mega-project") technology.] As a result, a good quantity of German-made 1-megabit DRAMs are now being sold. These are being followed by 4 megabits made with "mega-project" technology, so Holland will soon be known as a producer of chips 'n cheese as well as of bulbs.

### Early Hominid Mating Systems

In Table 1 of their article "Finite social space, evolutionary pathways, and reconstructing hominid behavior" (17 Feb., p. 901), Robert A. Foley and Phyllis C. Lee incorrectly characterize my model of early hominid social systems both in relation to its "key behavioral features" and to its "social structure," listing the former as "female mate choice and sexual selection" and the latter as "pairbonds (monogamy)." The key mechanism I proposed is what Darwin

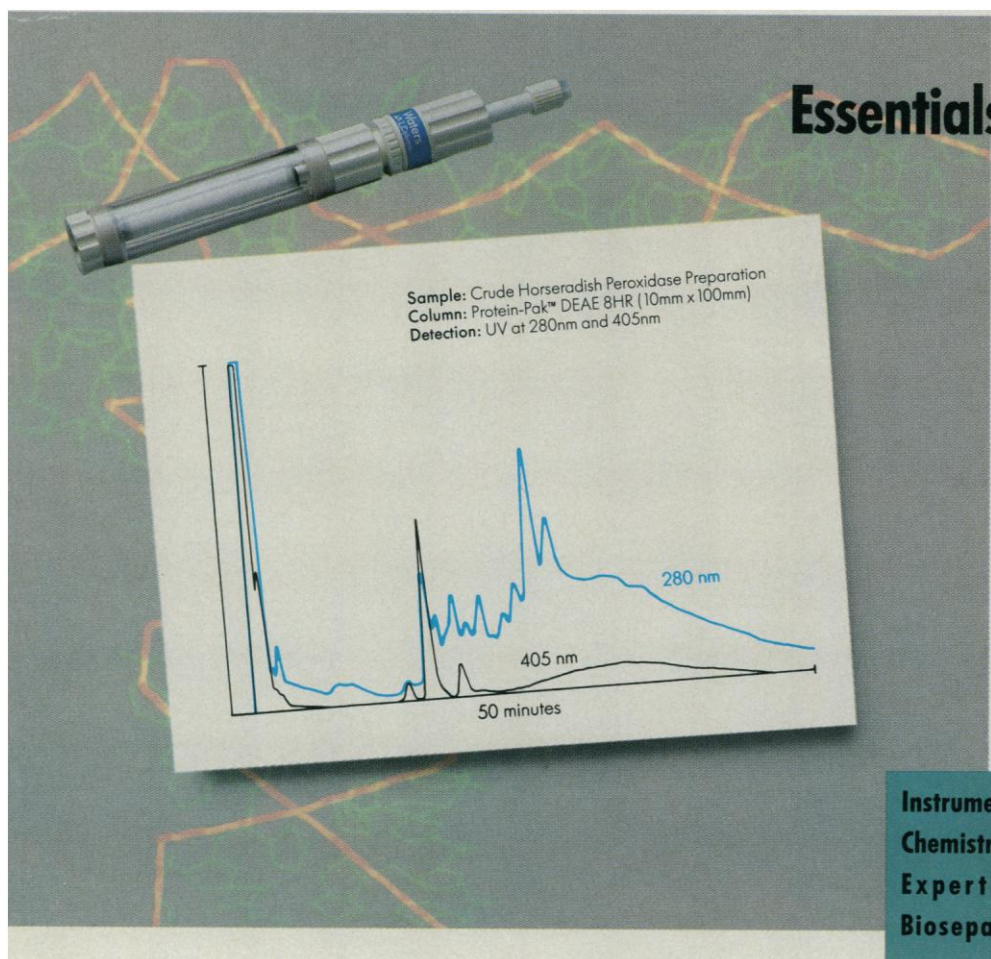

called "double selection," that is, both male competition and female choice *and* female competition and male choice. Likewise although I discussed various hominid mating systems, my key argument was that apehominid speciation (and bipedalism) occurred through intense male competition by means of nuptial food gifts to females of scavenged brains and bone marrow. I argued that, while males tried to mate with and control several females (resulting in polygyny), females tried to increase their access to food gifts through multiple matings (resulting in polyandry), and hence that the earliest hominids were to some degree promiscuous.

# GORDON RESEARCH CONFERENCES

"FRONTIERS OF SCIENCE"

## APPLICATION — MAIL EARLY

Please complete this application and mail (in duplicate)  
to the Director — **PLEASE PRINT.**

*Deadline for Receipt of Applications Is 6 Weeks  
Prior to the Conference*

## IMPORTANT NOTE

Applications are required from all individuals participating in a Conference. This applies to the Chairperson, Co-Chairpersons, Vice Chairperson, Discussion Leaders, Speakers, Poster Participants and Potential Conferees.

Conference on \_\_\_\_\_ Date: \_\_\_\_\_  
(Name of Conference — Please Print)

Name: (Please Print) \_\_\_\_\_ Conference Location: \_\_\_\_\_  
Organization: \_\_\_\_\_  
Business Address: \_\_\_\_\_ Accommodations (Room & Meals) For: \_\_\_\_\_  
(inc. dept., street & no.) \_\_\_\_\_  
City and State \_\_\_\_\_ Zip Code \_\_\_\_\_  
Applicant \_\_\_\_\_  
Spouse \_\_\_\_\_  
Child(ren) \_\_\_\_\_  
Total \_\_\_\_\_

### IMPORTANT

Please check if you have applied to another 1990 Winter Conference \_\_\_\_\_

### PROFESSIONAL ACTIVITIES:

What type of position do you have? Graduate Student \_\_\_\_\_ Post-Doctoral \_\_\_\_\_ Research Scientist \_\_\_\_\_ University Professor \_\_\_\_\_ Research Director \_\_\_\_\_ Program Manager \_\_\_\_\_  
Are you personally involved in research activities in subject area of Conference? \_\_\_\_\_ Yes \_\_\_\_\_ No  
How many papers have you published during the past 3 years in the subject area of the Conference? \_\_\_\_\_

Indicate your particular activities (separate page if necessary) which justify favorable consideration of you as a participant in and contributor to this Conference. (Not required of speakers.) Applications are referred to the Conference Chairperson for review and decision in accordance with the established regulations. Following the chairperson's approval the registration card will be mailed to you for completion. Please return registration card immediately with either a wire or check for Fixed Fee.

## FIXED CONFERENCE FEES — Winter, 1990 — CALIFORNIA

### \*FIXED FEES:

Conferee (double occupancy) (\$385 if postmarked 3 weeks prior to Conference)	\$435.00
Conferee (single occupancy) (\$495 if postmarked 3 weeks prior to Conference)	\$545.00
Guest (double occupancy) (\$275 if postmarked 3 weeks prior to Conference)	\$325.00
Guest (single occupancy) (\$385 if postmarked 3 weeks prior to Conference)	\$435.00

Children under 12 years of age are not permitted in the meeting rooms, dining rooms, or dormitories at any host sites.

1. Full fixed fee charged regardless of time conferee attends Conference. Please note fees.
2. \*Fixed fee cannot be prorated or reduced for anyone (speakers, discussion leaders, or conferees).

3. Refunds — See General Information under cancellations.

### PAYMENT:

The full fixed fee will be required IN ADVANCE of ALL PARTICIPANTS AND GUESTS. Attendance and accommodations will NOT be reserved unless this fee is received in our office 3 weeks prior to the Conference. Foreign participants will also be required to pay Gordon Research Conferences in advance in U.S. dollars payable by wire only to a U.S. bank. Checks drawn on Canadian banks and foreign banks cannot be accepted and will be returned. Scientists in Canada must use a bank draft obtained from their bank payable in U.S. dollars and drawn on a U.S. bank. Remittance information on the transfer must include the conferee's name, conferee number and Conference title. Detailed information on payment, travel, etc. mailed with registration material.

The recording of lectures by tapes, etc. and the photography of slide material are prohibited. Printed reference to Gordon Research Conference papers and discussion is not permitted. Authors are requested to omit references to the Conference in any publication. Guests are not permitted to attend the conference lectures and discussion sessions. Each member of the Conference agrees to these regulations when registration is accepted.

RECEIPT OF THIS APPLICATION WILL BE ACKNOWLEDGED — PLEASE DO NOT SEND PAYMENT WITH THIS APPLICATION

and streaming birefringence, which characterize chain conformation. These measurements are already well known for flexible chains, following the work of Flory and many others, but they have been less successful in the case of more rigid polymers (aromatic polyamides, cellulose and cellulose derivatives, polypeptides, polymeric liquid crystals), in part owing to experimental difficulties.

Tsvetkov has devoted much of his life to exploring such solutions, primarily using optical and hydrodynamic techniques. He belongs to the "Leningrad school," which has pioneered studies of polymer chain conformation. This book is a valuable collection of contributions from Tsvetkov and his associates, many of which have not been readily available to non-Russian-speaking readers.

Tsvetkov provides an excellent review of experiments and theory on this topic. He emphasizes the so-called "free-draining" state (as opposed to the non-draining case, where hydrodynamic interaction is important). This approximation, which is not good for coil-like molecules, becomes better

with increasing molecular rigidity. In such cases, the Kuhn segment length may exceed that for flexible-coil molecules by an order of magnitude or more, leading to their unique hydrodynamic, electrical, and optical properties. This arises in part from the effects of their rigidity on their equilibrium properties and thermodynamics, but largely from the effects of their dynamics on their motion in solution. The author extensively employs the worm-like-chain model introduced by Kratky, which gives rise to the concept of the persistence length as a measure of rigidity. A strong point of the book is the comparison of the behavior of rigid and flexible molecules.

The book presents a good discussion of translational and rotational motions of molecules and their effects on viscosity, streaming, and electric-field-induced birefringence. The presentation is "classical" and is, for the most part, readily understandable by physical chemists and engineers as well as by physicists. There are extensive references, many from the Russian literature. Relatively few references, however, date from after

1983, and the book misses important recent work in areas like liquid crystal polymers, the non-linear optical properties of such systems, and their employment in devices dependent upon their high molecular anisotropy. It also would have been desirable to include something about the commercial use of rigid-chain polymers in preparing high-performance fibers like Kevlar® and blends with flexible molecules to make "molecular composites."

Overall the presentation is clear, and the translation is good. There is a good mix of theory and experiment accompanied by extensive experimental details, and the book will prove a useful reference. It provides an excellent perspective for more recent developments.

## Principles of Route-to-Route Extrapolation for Risk Assessment Conference

**March 19-21, 1990**

**Mariner's Inn, Hilton Head, South Carolina**

Toxicologic data often exist for routes of exposure other than the route by which humans are environmentally exposed. This conference is concerned with the scientific issues related to route-to-route extrapolation as it is applied in risk assessment.

**The Conference will feature invited speakers and poster presentations on**

- **Structure and Function of Barriers to Uptake of Toxicants**
- **Physiological Parameters Associated with Uptake of Toxicants**
- **Critical Factors for Modeling Systemic Dose of Toxicants**
- **Implications for Route Extrapolations**
- **Implications for Risk Assessment and Future Research Needs**

Abstracts for posters are being solicited and will be accepted until December 15, 1989. The registration fee for the two-and-a-half-day conference is \$150.00.

For more information about attendance and poster submission, contact Janice Braswell, Conference Coordinator, NSI-ES, P.O. Box 12313, Research Triangle Park, NC 27709, (919) 549-0611.

The conference will be sponsored by the U.S. EPA and ILSI Risk Science Institute, Washington, DC.

## Research Grants from The Erna and Victor Hasselblad Foundation

The Erna and Victor Hasselblad Foundation will award grants for the year 1990 in order to promote scientific research and education in the field of natural science and photography.

Application for grants should reach the Foundation not later than January 31, 1990. Application forms may be obtained from the Foundation. Applications received after the above mentioned date will not be considered.

For the year 1990 SEK 8.000.000 (USD 1.200.000) is available for distribution. According to the statutes of the Foundation large projects will in the first place be considered for grants. Grants which are not concentrated on salaries are given priority. In principle medical projects will not qualify for grants.

Grants awarded are expected to be paid out before the end of June 1990.

Gothenburg in August 1989  
The Erna and Victor Hasselblad Foundation  
Box 53098, S-40014 Göteborg
