# Only Smart Diode Array Detection points out the impurities. In real time.

Smart Diode Array Detection shows you which peaks are impure. And how many components exist in each. Automatically, and in *real-time*.

Unique Purity Lines below each peak make it obvious. So you don't have to guess like you did with vague, unclear 3-D plots and isograms from older generation detectors. Or wait for time-consuming post-run analyses.

The next generation of diode array detection is here today. It's the System Gold™ 168 Diode Array Detector. It's Smart. And it's only from Beckman.

■ The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objectives are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, to advance education in science, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

**COVER** Chirp entrainment by the katydid *Mecopoda* to periodic acoustic stimulation at two different stimulus intensities: plots obtained by iteration of the Poincaré map. The abscissa represents input stimulus rate and the ordinate, phase. At each stimulus rate the map was iterated 50 times: the first 10 iterations are represented by yellow dots while the last 40 iterations (steady-state) are shown in red. The plots identify regions of phase-locked response. See page 55.

# Last Year, This Is How They Won The IBM Supercomputing Competition.

1st Place: Gas dynamics and star formation in merging galaxies.  
Kevin M. Olson,  
University of Massachusetts.

1st Place: 3-D reconstruction of cochlea structure.  
Carl S. Brown and  
Alan C. Nelson,  
University of Washington.

1st Place: Stretching and bending of material surfaces in turbulence.  
Stephen B. Pope and  
Sharath Girimaji,  
Cornell University;  
Pui-Kuen Yeung,  
Pennsylvania State University.

1st Place: A dependency parser for variable word order languages.  
Michael A. Covington,  
University of Georgia.

## This Year, This Is How You Can.

### Call For Papers

Last year, the response was overwhelming. So this year, the IBM Supercomputing Competition, with a new division, returns.

Created to discover, acknowledge and reward gifted American and Canadian scientists and engineers, this prestigious competition honors those whose papers describe innovative approaches to large-scale analysis and modeling.

Each paper must describe work using an IBM 3090™ Supercomputer and/or the paper must describe distributed or cooperative processing in which IBM technical workstations are linked to IBM mainframes.

The papers will be judged in five divisions: Physical Sciences and Mathematics; Engineering; Life and Health Sciences; Social Sciences, Humanities and the Arts; and Computer Sci-

ences—Distributed and Cooperative Processing (new division). Each division will receive a first, second and third prize of \$25,000, \$15,000 and \$10,000, respectively. Also, a "PROCEEDINGS" of selected papers will be published.

Contestants must register an abstract of their paper by October 16, 1990. Those who have registered their abstracts must forward their papers by January 15, 1991.

To select winners, IBM will retain a panel of independent authorities in each division. Winners will be announced by March 30, 1991.

For more information, contact your IBM marketing representative or call the IBM Supercomputing Competition Administrator at (203) 794-1355, FAX: (203) 792-7507 in the U.S.; (416) 758-4136 in Canada.

## This Week in SCIENCE

### Z boson developments

**I**N 1973 their existence was predicted; a decade later they were discovered; in 1989 they were reliably generated; and now their decay properties are being studied. Discovery of Z bosons (and W bosons), the vectors of nature's weak nuclear force, was crucial to validation of the standard model of high-energy physics. In his review of the state of Z boson art, Chanowitz describes the theoretical and experimental pathways that led to the prediction and discovery of Z bosons and the progress already made in searches for new particles and in defining quark-lepton families (page 36). The unified theory is tested and extended by this work and new theories and insights will be forthcoming from the continued interplay of experimentation and prediction. Accelerators of the future, such as the Large Hadron Collider and the Superconducting Super Collider, may shed brighter light on elementary particle physics and on the events that occurred immediately after the Big Bang.

### Mechanochemical protein

**K**INESIN is a protein that can convert chemical energy (stored in adenosine tri-phosphate) into mechanical force. Described as a "molecular motor," kinesin is thought to be a participant in the intracellular motility that occurs in association with mitosis, organelle transport, and the extension of endoplasmic reticulum. How is the activity of this molecule explained in terms of its molecular structure? Yang *et al.* prepared a number of truncated kinesin molecules and evaluated their ability to induce microtubule movement in an in vitro assay (page 42). The experiments showed that a 447-amino acid segment of the head domain of kinesin contained the elements needed for generating force and for inducing microtubule motility. The observations are consistent with a rotating head model of action that has been proposed for the related molecular motor myosin:

when the head of myosin binds to actin, it undergoes conformation and orientation changes that promote movement of the motor along the actin filament. The relevant head region has recently been shown to be conserved among proteins related to kinesin; therefore, it is likely that these proteins use similar structural motifs for carrying out their related mechanochemical functions.

### Storms, lightning, and videotape

**T**ELEVISION cameras have for the first time captured a rarely observed phenomenon, an upward flash of lightning (page 48). The flash looked like two fountains and lasted for 30 milliseconds. The discharge originated some 14 kilometers above the earth at the top of storm clouds and rose another 20 kilometers or so into the stratosphere. Upward lightning flashes have been observed only infrequently (usually by airline pilots) and differ in appearance from lightning flashes that travel from cloud to cloud or downward to the earth. Franz *et al.* suggest that the twin discharges originated from areas of intense positive charge at the cloud tops; dipoles are typically set up in clouds, and flashes either upward or downward serve to dissipate accumulated charge. Upward discharges might be the causes of unexplained transient flashes recorded during vigorous thunderstorms associated with hurricane Hugo. Through upward flashes, thunderstorm energy can get transferred into the magnetosphere.

### Isotopic clues to weathering and climate

**I**n the geologic record, diverse clues can be found to ancient climate conditions and their effects. One such clue is described by Capo and DePaolo who studied variations in the ratio of strontium isotopes in calcium carbonate-rich sediments (page 51). Overall during the past 2.5 million years, the ratio of  $^{87}\text{Sr}$  to  $^{86}\text{Sr}$  increased.

During three periods that were approximately 0.8 million years apart the ratio increased very rapidly whereas at most other times the ratio was stable or dropped. How do these ratio changes relate to paleoclimate and weathering? The episodes of rapid increase are best accounted for by accelerated chemical weathering of continental rocks. Precipitation and erosion release strontium from rocks and the rivers then carry the strontium to the oceans; riverine input has a higher  $^{87}\text{Sr}/^{86}\text{Sr}$  than does input from other sources. The rate of weathering is a reflection of climate, and changes in the weathering rate serve as a proxy for climate change. On the longer time scale, the strontium record shows that the rate of weathering increased significantly along with the initial development of glacial cycles about 2.4 million years ago.

### Synchronized singers

**C**RICKETS, cicadas, and katydids coordinate their chirps; fireflies flash in synchrony. These rhythmic synchronous insect behaviors have long been observed, but the phase locking has continued to be a mysterious phenomenon. Sismondo has now recorded Malaysian katydid songs and has mathematically analyzed the process of synchronization (page 55). The chirps of katydids are generated by their wings. The number of wing strokes per chirp varies between and is diagnostic of different species. Depending on the ambient temperature, the katydids chirped every 1.5 to 3.0 seconds. The synchronization of pairs of katydids could be accounted for by a mathematical formulation that considered duetting males as coupled oscillators. Once the pattern for synchronization was understood in theory, entrainment of pairs could be brought about experimentally with computer-iterated genuine chirps. The mathematical models that account for synchronization of chirping are thought likely to also account for the coordination of other forms of insect communication.

■ RUTH LEVY GUYER

## Auto-hydrolysis. The cornerstone of automated amino acid analysis.

Until now, "automated" amino acid analysis began with the hydrolyzed sample. The protein/peptide was hydrolyzed in a manual, multi-step procedure. The hydrolysate was extracted and transferred to the analyzer.

All this is changing with the Model 420A Amino Acid Analyzer, the first complete system to integrate hydrolysis, derivatization, chromatography and data analysis in one fully automated procedure.

Accurate, reproducible results become routine with automation and precise control of every step in the process. On-line auto-hydrolysis provides a solid foundation for higher sample recovery. Hands-off operation replaces manual sample handling, reducing the risk of contamination and sample loss during transfers. Throughput is higher. Once the first analysis is complete, the Model 420A reports the results on subsequent samples every 45 minutes.

Auto-hydrolysis. The systems approach to automated amino acid analysis requires it. Protein chemistry demands it. Contact Applied Biosystems for more information on the Model 420A today.

## cyclic AMP - ANTAGONIST Rp-cAMPS now available!

The R-isomer of cyclic adenosine - 3', 5' - monophosphothioate (Rp-cAMPS) blocks the signal transduction of the „second messenger“ cyclic AMP by inhibition of protein kinase A. It is the unique tool to proof probable cyclic AMP involvement in the system of interest and helps to focus on other messenger systems by suppressing the cyclic nucleotide pathway.

### Outstanding properties:

- **competitive antagonist for activators of the cyclic AMP signal pathway**
- **first cyclic nucleotide inhibitor of cAMP dependent protein kinase type I and II**
- **resistant towards mammalian cyclic nucleotide phosphodiesterases, no metabolites**
- **most potent cyclic nucleotide stimulator of gene transcription in E. coli**
- **penetrates cell membranes due to increased lipophilicity**
- **cyclic nucleotide analogue with only minor structural changes**

Rp-cAMPS is exclusively available from BIOLOG.

Forschungslabor und Biochemica - Vertrieb GmbH

## 1990 AAAS/WESTINGHOUSE AWARD for PUBLIC UNDERSTANDING of SCIENCE AND TECHNOLOGY

### Nominations Invited

- An annual Award for working scientists and engineers from all disciplines who make outstanding contributions to public understanding of science and technology but are *not* members of the media.
- The Award will be presented during the AAAS Annual Meeting in Washington, D.C., February 14-19, 1991.
- The Award carries a \$2,500 prize.
- Sponsors for the Award are the Westinghouse Foundation and American Association for the Advancement of Science.

1989 Award Winner: Robert D. Ballard  
Center for Marine Exploration  
Woods Hole Oceanographic  
Institution

For additional information, contact: **Patricia S. Curlin, AAAS Committee on Public Understanding of Science and Technology, 1333 H Street, NW, Washington, DC 20005 or call 202/326-6600.**

**Deadline for nominations is 1 August 1990.**

## IBC TECHNICAL SERVICES ARE PLEASED TO ANNOUNCE 7 FORTHCOMING CONFERENCES:

- (1) Bioseparations  
New Technologies in Upstream and Downstream Processing  
27th/28th September 1990, Cambridge, UK  
Chaired by Dr C.R. Lowe and Dr H.A. Chase
- (2) New Horizons in Dermatology  
Recent Breakthroughs and Likely Developments in the 90's  
1st/2nd October 1990, London
- (3) New Developments in Free Radical Research  
15th/16th October 1990, London  
Chaired by Professor T. Slater and Professor H.S. Jacob
- (4) Advances in Inflammation Research  
The Impact of New Developments  
31st October/1st November 1990, London
- (5) Monoclonal Antibodies for Clinical Use  
28th/29th November 1990, London
- (6) Potassium Channel Modulators  
Structure, Modulation and Clinical Exploitation  
6th/7th December 1990, London  
Chaired by Professor A. Weston
- (7) Anti-Virals  
11th/12th December 1990, London

For a full conference programme on any of the above events, please telephone Renata Duke, IBC Technical Services Ltd, in London on 071-236 4080.

IBC Technical Services Limited

## AAAS-WESTINGHOUSE SCIENCE JOURNALISM

# AWARDS

**NEWSPAPERS  
MAGAZINES  
RADIO  
TELEVISION**

---

*The 1990  
contest year is  
July 1, 1989  
through  
June 30, 1990.*

*All entries  
must be  
postmarked  
before  
midnight,  
July 14, 1990.*

For 39 years the AAAS–Westinghouse Science Journalism Awards have recognized outstanding reporting on the sciences and their engineering and technological applications, excluding health and clinical medicine. Awards honor science reporting in newspapers and general circulation magazines and on radio and television.

Entries are judged on the basis of their initiative, originality, scientific accuracy, clarity of interpretation, and value in promoting a better understanding of science by the public.

Five awards of \$2,500 each are made in the categories of: newspapers with daily circulation of over 100,000, newspapers with circulation of under 100,000, general circulation magazines, radio, and television.

The 1990 Awards will be presented at the National Association of Science Writers' banquet during the Annual Meeting of the American Association for the Advancement of Science in Washington, DC, February 15–20, 1991.

The Awards are administered by the American Association for the Advancement of Science under a grant from the Westinghouse Foundation.

*For further information and entry forms, contact the AAAS Office of Communications, 1333 H Street, NW, Washington, DC 20005, or call (202) 326-6440.*

**AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE**
