

Horns, Pronghorns, and Antlers. Evolution, Morphology, Physiology, and Social Significance. GEORGE A. BUBENIK and ANTHONY B. BUBENIK, Eds. Springer-Verlag, New York, 1990. xii, 562 pp., illus. \$89.

Horns, Pronghorns, and Antlers is, the editors note, a "rather unique" project, bringing together scientists in fields ranging from taxonomy to neuroendocrinology to deal with the subject of "cranial appendages." The volume opens with a set of six papers under the heading Evolution and Morphology. Anthony Bubenik leads off with a 110-page overview chapter in which he distinguishes between "horns" that are a product of skin and those that are protuberances of bone, reviews terminology for and taxonomy based on such structures, and discusses evolutionary and ontogenetic explanations for them. There follow another comparative and evolutionary discussion by C. M. Janis, focusing on the relation of reproduction and digestion in their evolution, and phylogenetic and morphological accounts of the Muntiacidae (muntjac and tufted deer) by C. P. Groves and P. Grubb, the Cervidae of Southeast Asia by Grubb, and the Bovidae of Africa by A. W. Gentry, along with a chapter by C. S. Churcher on the distinctive "cranial ornaments" known as ossicones in the Giraffoidea. The remainder of the book—Physiology, Genetics, and Behavior—is given over to more specialized papers. After an account (by B. E. O'Gara) of the pronghorn deer that appears to be more appropriate to the earlier section of the book, a dozen papers take up such topics as the neuroendocrine regulation of the antler cycle, the development of antlers as an example of metamorphosis, experimental induction of antler growth and regeneration, the relation between reproductive and antler cycles, nutritional requirements for antler growth, the relation of social dominance, hormonal changes, and antler development, and genetic variability in antler development. The volume ends with a combined reference list and indexes of fossil and extant pecora and "general terms."—K.L.
