Cell Cycle Arrest

We were pleased to see the three reports (1-3) and Research News article by Jean Marx (p. 963) in the 17 February issue that highlight the induction of the protein p21(WAF1) cyclin-dependent kinase (Cdk) inhibitor in myogenesis (1) and the high level of expression of p21(WAF1) in terminally differentiated tissues (2). These findings elegantly extend the findings published last fall in our papers "Induction of p21(WAF1/CIP1) during differentiation" (4) and "Induction of differentiation in human promyelocytic HL-60 leukemia cells activates p21, WAF1/CIP1, expression in the absence of p53" (5). We had reported that multiple differentiation inducers caused immediate-early and sustained up-regulation of p21 in many cell types through a p53-independent pathway. The report by Skapek *et al.* (3) demonstrating

p21(WAF1) reversal of a cyclin D1-mediated differentiation block in muscle raises the hope that in some settings p21(WAF1)-inducing agents may be anti-oncogenic. We would caution, however, that this strategy would be ineffective in settings in which p21(WAF1) induction is uncoupled from growth arrest. An example is our demonstration that deregulated c-myc expression is capable of uncoupling p21(WAF1) induction both from growth arrest and from differentiation (4).

"More" Is Not "Different"

I agree with Sheldon Krinsky (Letters, 17 Feb., p. 945) that "[m]odifying an inert chemical structure and modifying an organism are two very different things." Yet, he illogically extends this observation to a comparison of two organisms. Modification of an organism by traditional breeding and by recombinant DNA methods are not very different things. The fact that we can make a greater variety of changes by recombinant DNA is not an inherent reason to place a higher regulatory burden on products of recombinant DNA techniques.

Sampling Zooplankton: Correction

We have learned that there is an internal inconsistency in the zooplankton dataset used in our report "Climatic warming and the decline of zooplankton in the California Current" (3 Mar., p. 1324) (1). The data

Go Germline!

...when you make your knockouts with Embryonic Stem (ES) cells and Mouse Embryo Fibroblasts (MEF) from Genome Systems, Inc.

Making a mouse knockout involves months of hard work. But all that work can be wasted if you don't start with a strong foundation. You need high quality ES cells that will go germline after blastocyst injection and MEF cells to maintain ES cells in their pluripotent state.

Genome Systems, Inc., has contracted with a major facility to offer you the cells you need to generate knockouts. Our ES cells and MEF cells are fully characterized with a strong proven record of success.

SAVE YOUR COPIES OF SCIENCE

CASES These custom-made, imprinted cases and binders are ideal for protecting your valuable Science copies from damage. Each binder or case holds one volume of Science, or 13 weekly issues — order four binders or cases to hold a complete year of issues. Constructed from reinforced board and covered with durable, leather-like red material and stamped in gold, the cases are V-notched for easy access; binders have a special spring mechanism to hold individual rods which easily snap in.

BINDER
