AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

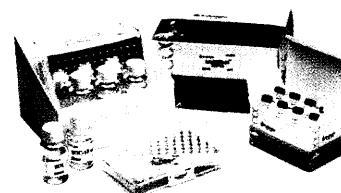

Arm yourself with high volume PCR cloning.

HTP TOPO® Cloning Kits give you the upper hand.

For high-throughput (HTP) cloning, you need a method that's reliable, fast, and simple to use. Introducing the HTP TOPO® Cloning Kits. Now you can clone hundreds of PCR products quickly and easily—and keep your competitors at arm's length.

Ideal for HTP. TOPO® Cloning uses topoisomerase I, rather than DNA ligase, for more effective ligations. Simply combine a TOPO® vector and your PCR products in multi-well

plates, then incubate for 5 minutes at room temperature. You'll get >95% recombinants every time. High efficiency, speed, and reproducibility make TOPO® Cloning ideal for your HTP cloning projects.

Choose your solution. With four vectors to choose from and chemically competent *E. coli* in bulk or pre-aliquotted into 96-well plates, the HTP TOPO® Cloning Kits are the best way to clone PCR products—hands down.

The reproducible results, speed, and efficiency of HTP TOPO® Cloning Kits will put you beyond the reach of your competitors. Call Invitrogen today.

A Brilliant solution to high-priced QPCR core reagents

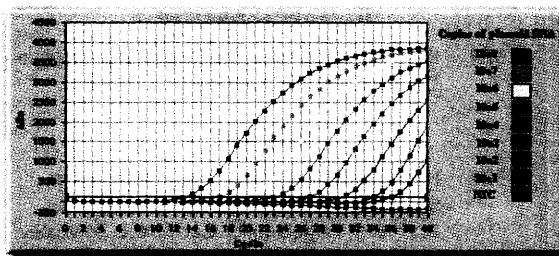

Brilliant™

QPCR & QRT-PCR CORE REAGENT KITS

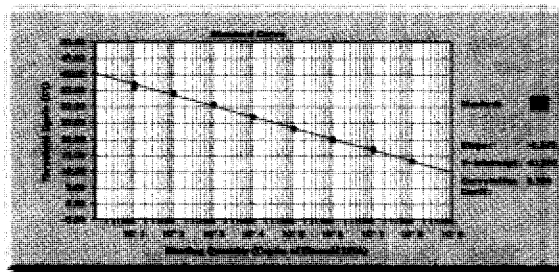

NEW Brilliant QPCR & QRT-PCR core reagent kits are compatible with ALL fluorescent primer and probe technologies, and priced right.

- SureStart™ Taq for hot start capability
- Brilliant™ Plus kits include Uracil-DNA-N-Glycosylase for carry-over contamination control strategies
- Passive reference dye included as a separate component

*Don't pay
outrageous prices for
QPCR core reagents
anymore!*

Sensitive Enough to Detect as Few as 10 Copies of Plasmid DNA
Molecular beacon chemistry was used to detect 10¹ to 10⁸ copies of plasmid DNA. The standard curve was linear over eight orders of magnitude, eliminating the need to analyze serial dilutions of experimental samples for gene quantification.

New

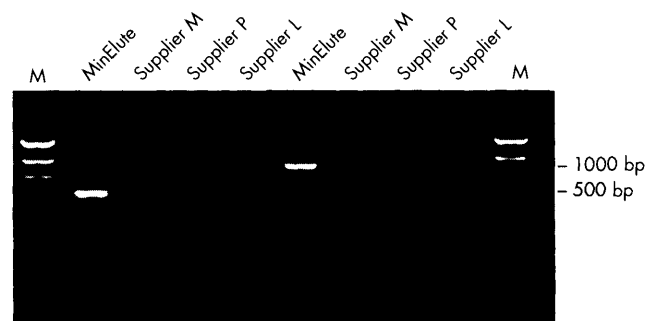

**Do You Want
Highest DNA Concentration in
Only 10 µl Elution Volume?**

**Use New MinElute Kits for
Gel Extraction and
PCR Purification!**

Advantages of MinElute™ Kits

- **Elution volumes reduced to a minimum** — highest DNA concentrations in only 10 µl
- **High speed** — purification of PCR products in 6 minutes, gel extraction in 18 minutes
- **Convenience** — advanced silica-gel-membrane spin technology
- **High recoveries** — 80% of 70 bp to 4 kb fragments

More Concentrated DNA Purified Using MinElute Kits

A 500 bp and a 1000 bp fragment purified using the MinElute Gel Extraction kit and 3 different silica-based DNA purification kits from the suppliers indicated. From each eluate 2 µl aliquots were loaded onto a 1.5% agarose gel. M: markers

DIPOLAR PHASE SEPARATION

The phase separation of simple fluids at a critical temperature into a high-density liquid and a lower density gas can be readily modeled in terms of a competition between hard-core repulsive forces and an attractive short-range (van der Waals) isotropic force. In dipolar fluids, such as ferrofluids or electro-rheological fluids, the attractive force is caused by long-range, anisotropic dipolar forces. Accurate modeling of these more complex systems has remained elusive. Flusty and Safran (p. 1328; see the Perspective by Pincus) recast the problem to take into account the natural tendency for the dipolar molecules to form chains and branches. The results of the model reveal that such an approach can describe experimental data in which the low-density phase consists of repulsive individual chains, and the higher density phase comprises more attractive branches.

NANOTUBE FIBERS TIE THE KNOT

One method used to enhance the mechanical strength of organic polymers is to stretch and align the molecules before they are drawn into a fiber. Vigolo *et al.* (p. 1331; see the Perspective by Baughman) show how flow-induced alignment can be used to orient single-wall carbon nanotubes (SWNTs) in solution before they are formed into macroscopically long ribbons with widths ranging from a few to 100 micrometers. The raw nanotube soot is dispersed in aqueous solution through sonication with a surfactant and then injected into a solution that condenses the fibers. The fibers exhibit a mechanical modulus of 15 gigapascals, lower than that of individual SWNTs but greater than the 1-GPa or lower modulus typically seen for unoriented nanotube sheets. Unlike classical carbon fibers, the nanotube fibers show plastic behavior before they break—and can even be tied into knots.

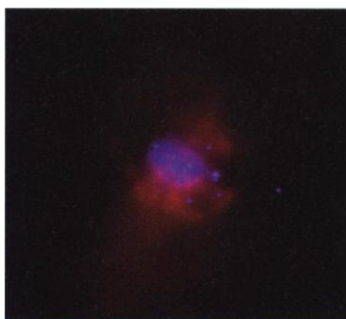

EARTHQUAKE PATTERNS

In 1992, the magnitude 7.3 Landers earthquake in the Mojave Desert of southern California was followed 2 hours later by the magnitude 6.5 Big Bear earthquake to the west. Seven years later, the magnitude 7.1 Hector Mine earthquake occurred to the east. The timing of these events and other data indicate that Big Bear was triggered by Landers, but it has not been clear whether the Hector Mine quake can be associated with Landers. Wyss and Wiemer (p. 1334) have analyzed the change in the rate of seismicity between 1981 and 1999 in the

area around Landers. They show that after Landers, the number of small earthquakes that occurred during the next 7 years in the Hector Mine area increased by an order of magnitude. Thus, the Landers earthquake altered the near-field stress regime, triggering the Hector Mine earthquake after a relatively long period of time of increased but low-level seismicity.

HOT AND MASSIVE STARBURST

Messier 82 (M82) is considered to be a prototypical starburst galaxy, and its proximity to the Milky Way (located just outside the Local Group) makes it an important target for observations aimed at understanding star formation. Griffiths *et al.* (p. 1325) have used the

high-spatial-resolution imaging spectrometer on the Chandra X-ray Observatory to probe the interior of this galaxy. They found a high-temperature (about 40 million kelvin), high-pressure plasma in the center of M82 that is probably related to supernovae. They also distinguished about 20 x-ray point sources that are probably massive binary stars, many of which may harbor black holes.

SEDIMENTARY JOURNEY

Geophysical observations of the core-mantle boundary (CMB) indicate the presence of zones or a thin layer of low seismic velocities and high electrical conductivity. Buffett *et al.* (p. 1338; see the news story by Kerr) suggest a sedimentation model at the CMB to explain these two observations. In their model, silicate sediments "pond" at the top of the outer core along with interstitial iron-rich liquid. Iron liquid and other lighter elements can be extracted from the core into the mantle by viscous compaction and could explain, for example, the traces of core elements sampled at hotspot plumes. The removal of lighter

elements could also enhance the vigor of mantle convection and improve the efficiency of the geodynamo.

INVERTED CO₂

The rate at which fossil-fuel CO₂ emissions are absorbed by the ocean and the terrestrial biosphere is important for understanding the modern carbon cycle and for evaluating emission management strategies. Bousquet *et al.* (p. 1342; see the Perspective by Fung) used an inverse model with 20 years of atmospheric CO₂ measurements in order to infer year-to-year changes in the regional carbon balance of oceans and continents during the period from 1980 to 1998. On a global scale, terrestrial carbon fluxes were approximately twice as variable as ocean fluxes. Tropical land ecosystems produced most of the interannual variability in the Earth's carbon balance during the 1980s, whereas in the 1990s, mid- and high-latitude land ecosystems of the Northern Hemisphere caused most of the important shifts in the carbon balance.

FOOD FOR MODELING

Understanding simple ecological communities under laboratory conditions should provide a foundation for understanding the dynamics of organisms in the wild. Fussmann *et al.* (p. 1358) report the correspondence between laboratory experiments on a system with a nutrient (nitrogen), an alga, a rotifer herbivore, and a nonlinear mathematical model that incorporates nutrient concentration and the population density of both predator and prey. The model makes several predictions according to the interplay of these variables: either extinction of the predator or both predator and prey, coexistence of both species at equilibrium, or coexistence as stable predator-prey cycles. In 15 out of 16 trials, run over a period comparable to an average summer growing season, the model successfully predicted the experimental outcomes.

EVALUATING HABITAT FRAGMENTATION

There is growing interest in spatial synchrony in animal population dynamics, and Earn *et al.* (p. 1360) now report a way to make theoretical predictions about the population consequences of conservation corridors and other manipulations of movements of endangered species. For any given pattern of dispersal, their models determine the likelihood of synchronous fluctuations

You Really are Seeing Double...

Mini-Prep 24

FOR FULLY AUTOMATED
PLASMID MINI-PREPS

Introducing the new
short body cassettes that
give you twice the yield...
at no extra cost.

The Mini-Prep 24 uses a
revolutionary new method of plasmid purification
based on agarose gel electrophoresis and
subsequent recovery by electroelution...all done automatically!

High Purity - for fluorescent and
manual sequencing

Easy Operation - begin prep with
direct loading of 2 mls bacteria culture

Consistent Results - up to
6 μ g of plasmid per lane

Fast - up to 24 preps per hour

Affordable - list price under \$8100

**NO
CENTRIFUGATION
STEPS**

Now with Twice the Yield Call to learn how the Mini-Prep 24
can have you seeing double the yield of plasmid DNA.

THIS WEEK IN SCIENCE

CONTINUED FROM PAGE 1257

in species abundances and corresponding probabilities of local and global extinction. The results can be used to evaluate proposals for conservation measures and schemes for pest control.

SOME TRACKS ALREADY LAID

Development of the cortical connections between eye and brain has long been thought to be a process by which certain anatomical structures form in response to visual activity. By observing earlier time points in development, Crowley and Katz (p. 1321; see the cover and news story by Wickelgren) now show that the ocular dominance columns thought to be a result of activity-dependent refinement are actually present well before visual activity and the other related neuronal interconnections. Thus, the critical period, which refines and supports further visual capacity, seems to be operating on pre-established anatomical structures, rather than directing the formation of those structures.

SYNAPTIC RIPENING

Although synapses have been studied in great detail, the basic mechanisms underlying synapse formation are still poorly understood. El-Husseini *et al.* (p. 1364) studied the effects of the synaptic scaffolding protein PSD-95 on excitatory synapse maturation in cultured hippocampal neurons. Chronic overexpression of PSD-95 accelerated synapse maturation both pre- and postsynaptically. PSD-95 increased synaptic accumulation of glutamate receptors. This effect occurred in both excitatory pyramidal neurons and inhibitory interneurons and required the localization of PSD-95, but not its guanylate kinases domain, to synapses. Finally, overexpression of PSD-95 caused an increase in the number and size of dendritic spines.

CUTTING BACK ON SUGARS

Alternative genetic systems that could be synthesized under prebiotic conditions are of interest in studies of the origin of life. Schöning *et al.* (p. 1347; see the Perspective by Orgel) have synthesized oligomers in which nucleosides of the tetrose sugar, threose, are joined by phosphodiester bonds to form "TNAs." Tetroses are simpler to synthesize than pentoses because they can be made from two identical two-carbon fragments. Complementary TNA strands form stable double helices with Watson-Crick base pairing, and the TNAs also form stable double helices with RNA and DNA.

THE RIGHT BITE

Leishmaniasis constitutes a spectrum of disfiguring and disabling human diseases found throughout warmer parts of the world that are caused by several species of intracellular protozoan parasites called *Leishmania*. The *Leishmania* species are transmitted to humans and many wild and companion animals by the bite of tiny but annoying sand flies. Kamhawi *et al.* (p. 1351) have shown in mice that the bite of uninfected sand flies (*Phlebotomus papatasi*) alone will prevent *Leishmania major* infection of the mice during subsequent biting by infected sand flies. A delayed type hypersensitivity reaction, triggered by an as-yet unknown component of sand fly saliva, is the basis for this protection.

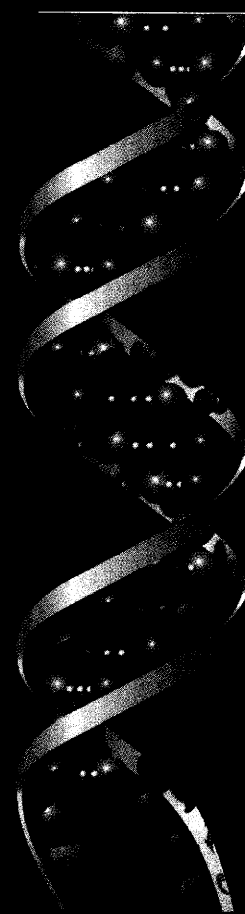

CALCIUM AND INFECTIONS

One of the most prevalent fungal respiratory diseases of human beings is caused by *Histoplasma capsulatum*. This pathogen lurks as a mold in the soil, but if it is disturbed and inhaled by a mammal, it undergoes a temperature-triggered transformation into a pathogenic yeast that can spread from the lungs via intracellular parasitism of macrophages. Schurtz Sebgathi *et al.* (p. 1368) have used novel methodology that will likely be broadly applicable to other important fungal pathogens to define the role of a calcium-binding virulence factor in pathogenesis. Unlike the mold form, the yeast form can survive low calcium conditions within macrophage compartments.

TWO FACES OF CYTOTOXIC MOLECULES

Perforin and interferon- γ (IFN- γ) are two powerful products used by CD8⁺ T cells in response to viruses and some bacteria. Perforin is exclusively cytotoxic, whereas IFN- γ has multiple antimicrobial effects. Another function for these effector molecules—distinct from that of fighting infection—has now come to light. Badovinac *et al.* (p. 1354) infected gene-deficient mice with bacteria or viruses and observed that the growth and eventual decline of the responding CD8⁺ T cells required expression of perforin and IFN- γ , respectively. In addition, IFN- γ modified which clones of T cells responded to a given antigenic epitope presented by the viruses and bacteria. This unexpected regulatory role of perforin and IFN- γ in the cytotoxic immune response may prove important in future vaccination strategies.

Setting the Standard

- High Throughput DNA Sequencing
- 24-48 Hour Turnaround
- Guaranteed Results

SeqWright is the established leader in providing rapid service with guaranteed results.

We offer a full spectrum of sequencing and related services: PCR products, FDA submission quality sequencing, Cosmid and BAC inserts, mutation detection, genotyping and more.

THE
FASTEST
SERVICE IN THE
INDUSTRY,
WITH
GUARANTEED
RESULTS.

Applied Biosystems roots go back to the origins of PCR. We were instrumental in its development and remain the world's leading source of innovative PCR technology, with a growing line of products known for performance and reliability. Products like the new GeneAmp® Gold PCR Reagent Kit.

Multiplex PCR in GeneAmp Gold Buffer vs. GeneAmp Gold Buffer II

aMultiplex amplification of a 500 bp product from a 100 ng DNA template in either GeneAmp Gold Buffer or GeneAmp Gold Buffer II with a 10 or 3 minute pre-PCR activation step at 95° C as indicated.

Self-contained and ready for amplification, the GeneAmp® Gold PCR Reagent Kit comes with AmpliTaq Gold® DNA Polymerase, our premium chemical Hot Start enzyme with Time Release capability, our new and improved Gold buffer, and dNTPs—and the confidence that comes from working with Applied Biosystems. Tap into our expertise. For more information on the GeneAmp Gold PCR Reagent Kit, contact your Applied Biosystems Representative, call 800.638.5800, or visit www.appliedbiosystems.com.

With roots this strong,

we can't help but grow.

GeneAmp® Gold PCR Reagent Kit

PE Corporation is committed to providing the world's leading technology and information for life scientists. PE Corporation consists of the Applied Biosystems and Celera Genomics businesses.

AmpliTaq Gold and GeneAmp are registered trademarks of Roche Molecular Systems, Inc. The PCR process is covered by patents owned by Roche Molecular Systems, Inc. and F. Hoffmann-La Roche Ltd. Don't Kill the Messenger RNA

RNAlater™
protects RNA from
degradation!

Stabilize RNA in
tissue and cells
for weeks at 25°C,
months at 4°C or
indefinitely at -20°C

No dry ice or
liquid nitrogen
needed for sample
collection

Ideal for tissues,
cultured cells and
buffy coats

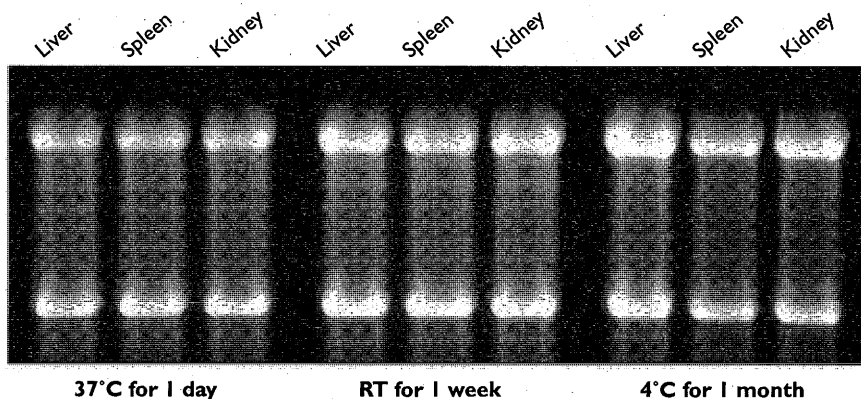

Figure 1a. Quality of RNA isolated from Tissue Stored in RNAlater™ Solution. Fresh mouse tissues were dissected and stored in RNAlater™ at 37°C for 1 day, room temperature for 1 week, or 4°C for 1 month. RNA was isolated using TRI Reagent® (MRC) and analyzed using denaturing agarose gel electrophoresis.

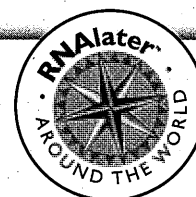

RNAlater™ is an extraordinary reagent that allows you to harvest and dissect samples for RNA isolation in a whole new way!

RNAlater quickly permeates cells and tissues at room temperature, rapidly inactivating RNases. Tissues or cells simply submerged in RNAlater can be stored, dissected and even shipped at room temperature. Imagine removing a sample from the freezer, dissecting a portion for RNA isolation and archiving the remainder— it's possible with RNAlater. RNAlater is compatible with all RNA isolation procedures tested.

With RNAlater, you don't have to worry about killing or degrading those precious mRNAs during sample collection and handling.

MORE INFORMATION INSTANTLY

For instant information about RNAlater™, email rnalater@ambion.com. Information may also be obtained by phone, fax or the reader service number below.

RNAlater™
AROUND THE WORLD
...a regular TechNotes feature.

"The RNAlater™ works!"
One satisfied researcher, tired
of constant harassment by
the surgeons in O.R, traded
in his liquid nitrogen and
Dewars for RNAlater™.

Unparalleled access to the genomics frontier

Integrated resources that help you navigate vast seas of data

DoubleTwist.com's secure, comprehensive research environment helps you chart your course for genomic exploration. By providing a single point of access to multiple public and proprietary databases (including the DoubleTwist Annotated Human Genome Database)—as well as a suite of automated research agents and sophisticated visualization tools—DoubleTwist.com guides you toward the answers you need.

Indispensable in uncharted territory

The affordable, unrestricted way to support your expedition

DoubleTwist's scalable, cost-effective, subscription-based solutions give any life scientist access to a powerful discovery platform. And because DoubleTwist is a neutral service provider, we do not assume any rights to your discoveries or developments made from these discoveries. Whether you're searching for homologues or potential full-length cDNAs, on the lookout for new gene family members or alternative splice forms, there's no better compass for navigating the genomics frontier than DoubleTwist.com.

Register today at www.DoubleTwist.com—
and launch *your* genomics discovery mission.

Published by the American Association for the Advancement of Science (AAAS), *Science* serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objectives are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, to advance education in science, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

Boost Your Gene Expression

with BoosterExpress™ Reagent Kit

Bummer!

Without BoosterExpress™ reagent kit

- Highest gene expression in diverse cell types
- Excellent enhancement with all GenePORTER™ transfection reagents
- Great boost with other transfection reagents
- Effective for both transient and stable transfections
- Extended shelf life, easy to use, and economical

BoosterExpress™ reagent kit is a set of chemical cocktails developed by Gene Therapy Systems, Inc. This kit increases expression levels when used with synthetic nonviral DNA delivery systems such as GenePORTER™ or GenePORTER™ 2 transfection reagents. The BoosterExpress™ kit also can be used with other commercially available transfection reagents. Three unique reagent formulations are included for a variety of cell types.* BoosterExpress™ reagents are very easy to use: Simply add the appropriate booster to your culture medium 4 hours post-transfection. Enhance your gene expression up-to 12-fold with the BoosterExpress™ reagent kit.

BoosterExpress™ Reagent Kit

Catalog # T20100B

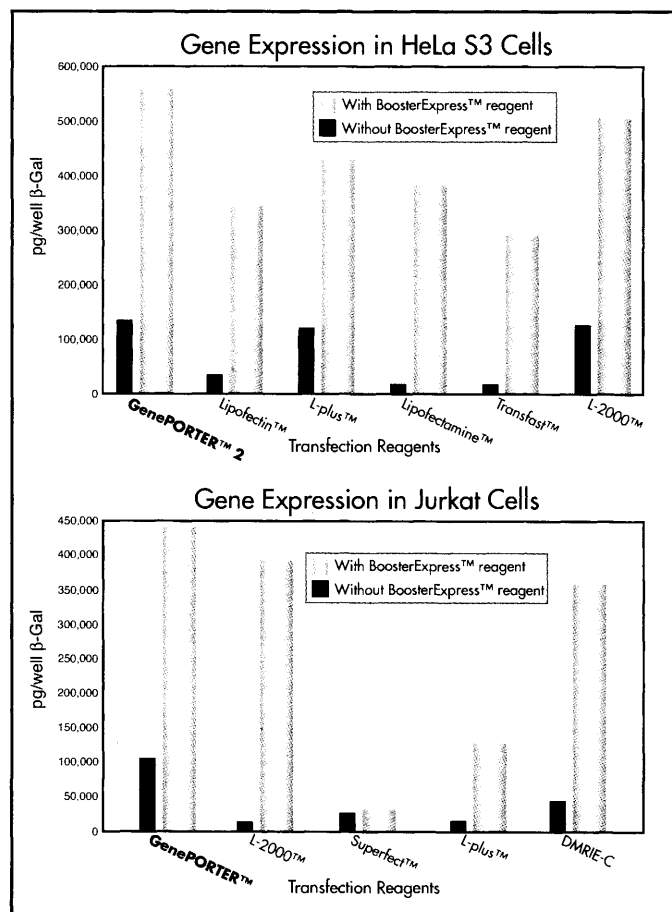

Special discount when purchased with any GenePORTER™ transfection kit.

* Additional information about these reagents are available on our website.

12 X better expression dude!

With BoosterExpress™ reagent kit

Circle No. 52 on Readers' Service Card

Deciphering the code of human existence requires a special set of tools.

APPLY THE POWER OF AFFYMETRIX® GENECHIP®
HUMAN GENOME U95 SET. With more than
60,000 full-length genes and EST clusters,
the GeneChip Human Genome U95 Set
offers the most extensive coverage of the
human genome available. This robust and
highly reproducible set of arrays is designed
specifically for uncovering relationships
between known genes, revealing the function
of uncharacterized genes and building
quantitative human expression databases.

The Human Genome U95 Set builds on previous
GeneChip human genome arrays with more sequence
information and higher densities than ever
before. Expanded manufacturing capacity
now makes it possible for Affymetrix to
offer the new 5-array set immediately to all
bioresearchers interested in exploring the
mysteries of human gene expression.
DISCOVER MORE. Contact your Affymetrix
representative or visit our website at

IT WORKED OK,

BUT THEN AGAIN,

µg of cell lysate

NOW

SEE THE FUTURE

transAM™

The future in studying transcription activation.

Trans-AM combines high sensitivity with high throughput in assaying activation of transcription factors from mammalian tissue or cell extracts.

Trans-AM NFκB uses an oligonucleotide containing an NFκB consensus site immobilized to a 96-well plate at high densities*. The active form of NFκB contained in cell extracts specifically binds to this oligonucleotide. Trans-AM uses an ELISA format with colorimetric readout.

Trans-AM allows accurate quantitation in matter of hours instead of days. Radioactive probes, endless gel exposure, troublesome cloning or inefficient cell transfection is no longer required to measure transcription factor activation. Inconsistencies due to variable reporter plasmid transfections are eliminated as is the need to construct stable cell lines carrying reporter genes.

Trans-AM NFκB p50 and p65 assay kits are now available.

Trans-AM API and Trans-AM CREB coming soon!

*Technology covered by AAT filed patents and licensed exclusively to Active Motif.

Applications in signaling pathway investigation:

- Drug screening and/or potency
- Inhibitor or activator protein study
- Cytokine stimulatory effect
- Protein structure/function study

Advantages:

- Procedure 10-fold more sensitive than gel shift
- Yields result in less than 3.5 hrs
- Allows quantitative study from cell or tissue extract
- Compatible with high-throughput systems
- Non radioactive assay, no cell transfection hassles

ACTIVE MOTIF

Cell Biology Tools for Gene Discovery

Active Motif carries a line of antibodies to the NFκB pathway for further analysis.

Antibodies: A20 Phosphorylated-Akt1 IkBα Phosphorylated-IkBα IKKα IKKβ IKKγ TBK1 IRAK-1 IRAK-2 MyD88 NFκB p65 RANK TAB1 TRAF2 TRAF5 TRAF6

PerkinElmer Life Sciences and NEN working together?

precisely.

Measured Success

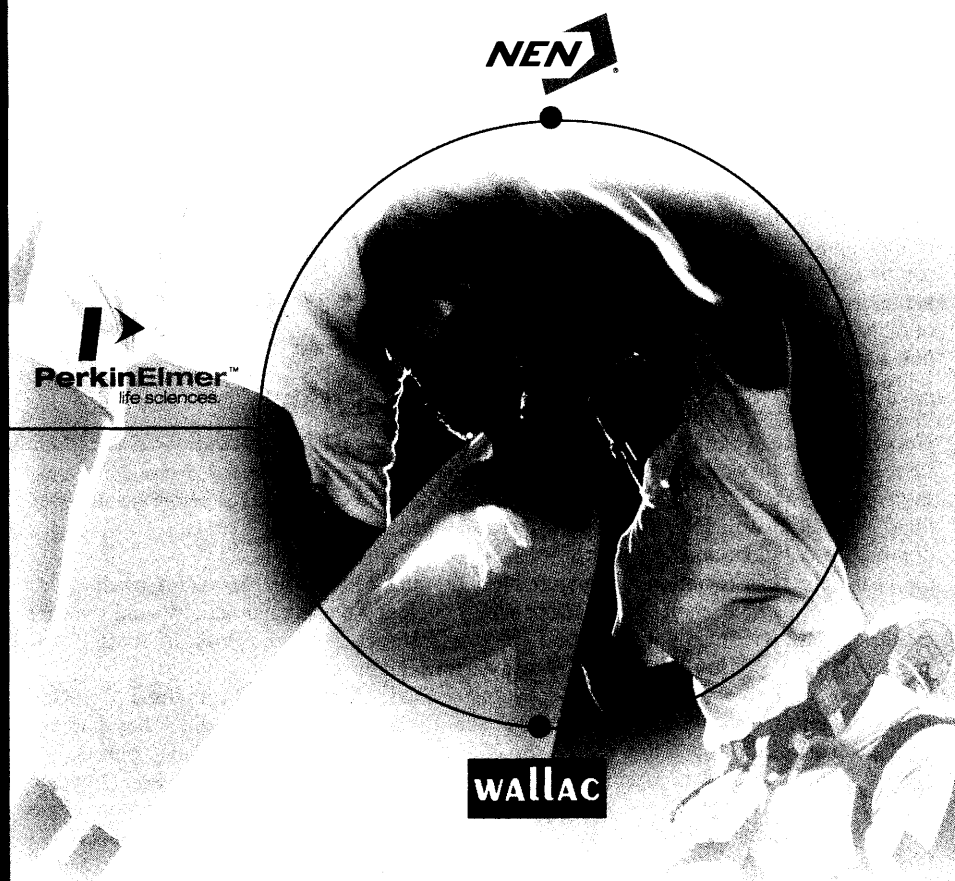

PerkinElmer and NEN are a perfect team. A combination so complementary it just had to happen. The premier life sciences brand in reagent systems joins the leader in biomedical, drug discovery and research instrumentation. Together, providing complete assay and research solutions to life science researchers everywhere.

Here's what this means to you:

The New PerkinElmer

- Leading-edge solutions in emerging fields such as functional genomics, biochips, SNPs, live cell imaging and "next generation" detection reagents.
- A complete line of instrumentation for liquid scintillation, fluorescence and luminescence detection, plus over 2,000 reagents and consumables.
- Complete assay development and instrumentation systems for high throughput screening and other areas involved in target validation for drug discovery.
- Optimized solutions through increased sales and technical support worldwide.

Prime RNase Inhibitor

Your best defense against RNases

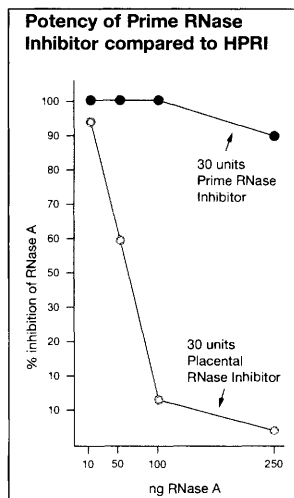

RNases are insidious proteins just lying in wait to destroy your experiments. You need the most powerful weapons to defeat them. DEPC and other treatment methods are great for destroying RNases that are already in solutions and on your labware, but to fight the exogenous RNases that can ruin your experiments you need a more powerful weapon. That weapon is Prime RNase Inhibitor!

Prime RNase Inhibitor exhibits the same specificity as Human Placental RNase Inhibitor (HPRI) but has several advantages, including:

- Inhibits greater than 90% of RNase activity, where Human Placental RNase Inhibitors (HPRI) inhibit only 50%
- Stable under a broad range of pH concentrations
- Temperature stable to 65°C for at least 20 minutes
- Inhibits RNases A, B and C, and does not interfere with RNases T1, T2, H, U1, U2, or CL3
- Costs less than 1/2 the price of HPRI

Prime RNase Inhibitor works by non-covalently binding RNases and preventing RNA degradation. It can be used for all your RNA experiments including: *in vitro* transcription and *in vitro* translation, first and second strand cDNA synthesis, preparation of RNA and mRNA, and RT-PCR*. So contact your Eppendorf representative today, because the best defense is a superior offense.

For more information, visit us on the web at www.rnase.com.

CLONTECH's Atlas™ Nylon and Glass Expression Arrays offer sensitive analysis of differential gene expression—each with unique advantages. Nylon arrays hybridized with ³²P-labeled probes provide the most sensitive detection method and require no specialized equipment for hybridization and analysis. Glass microarrays, on the other hand, offer the convenience of high-resolution fluorescent detection and dual-color labeling for hybridizing two probes on a single array*. Either way, Atlas Arrays give you access to carefully selected **human, mouse, or rat** genes from a wide range of biological pathways. And because we print nonhomologous DNA, you'll have minimal cross-hybridization for the most accurate and reliable results. Nylon or glass? You decide.

A DIVERSE WORLD REQUIRES EXCEPTIONAL TRANSLATORS.

The Human Genome Project marks the beginning of what will truly be a Genetic Age. Understanding the genetic code may save and extend lives in ways we can only imagine. But first, the massive amounts of data produced by this extraordinary effort must be translated into specific genetic information. This will help scientists improve the

quality of our lives and understand both how we are alike—and how we differ. Generating this information requires exceptionally powerful tools.

Affymetrix GeneChip® technology provides these tools. Based on semiconductor fabrication methods,

GeneChip arrays contain vast quantities of genetic information where hundreds of thousands of experiments can be performed at the same time.

Many fields are poised to benefit from this technology. Already, leading pharmaceutical and academic researchers use Affymetrix technology to understand gene function, uncover medically relevant genetic variations and design targeted therapeutic products.

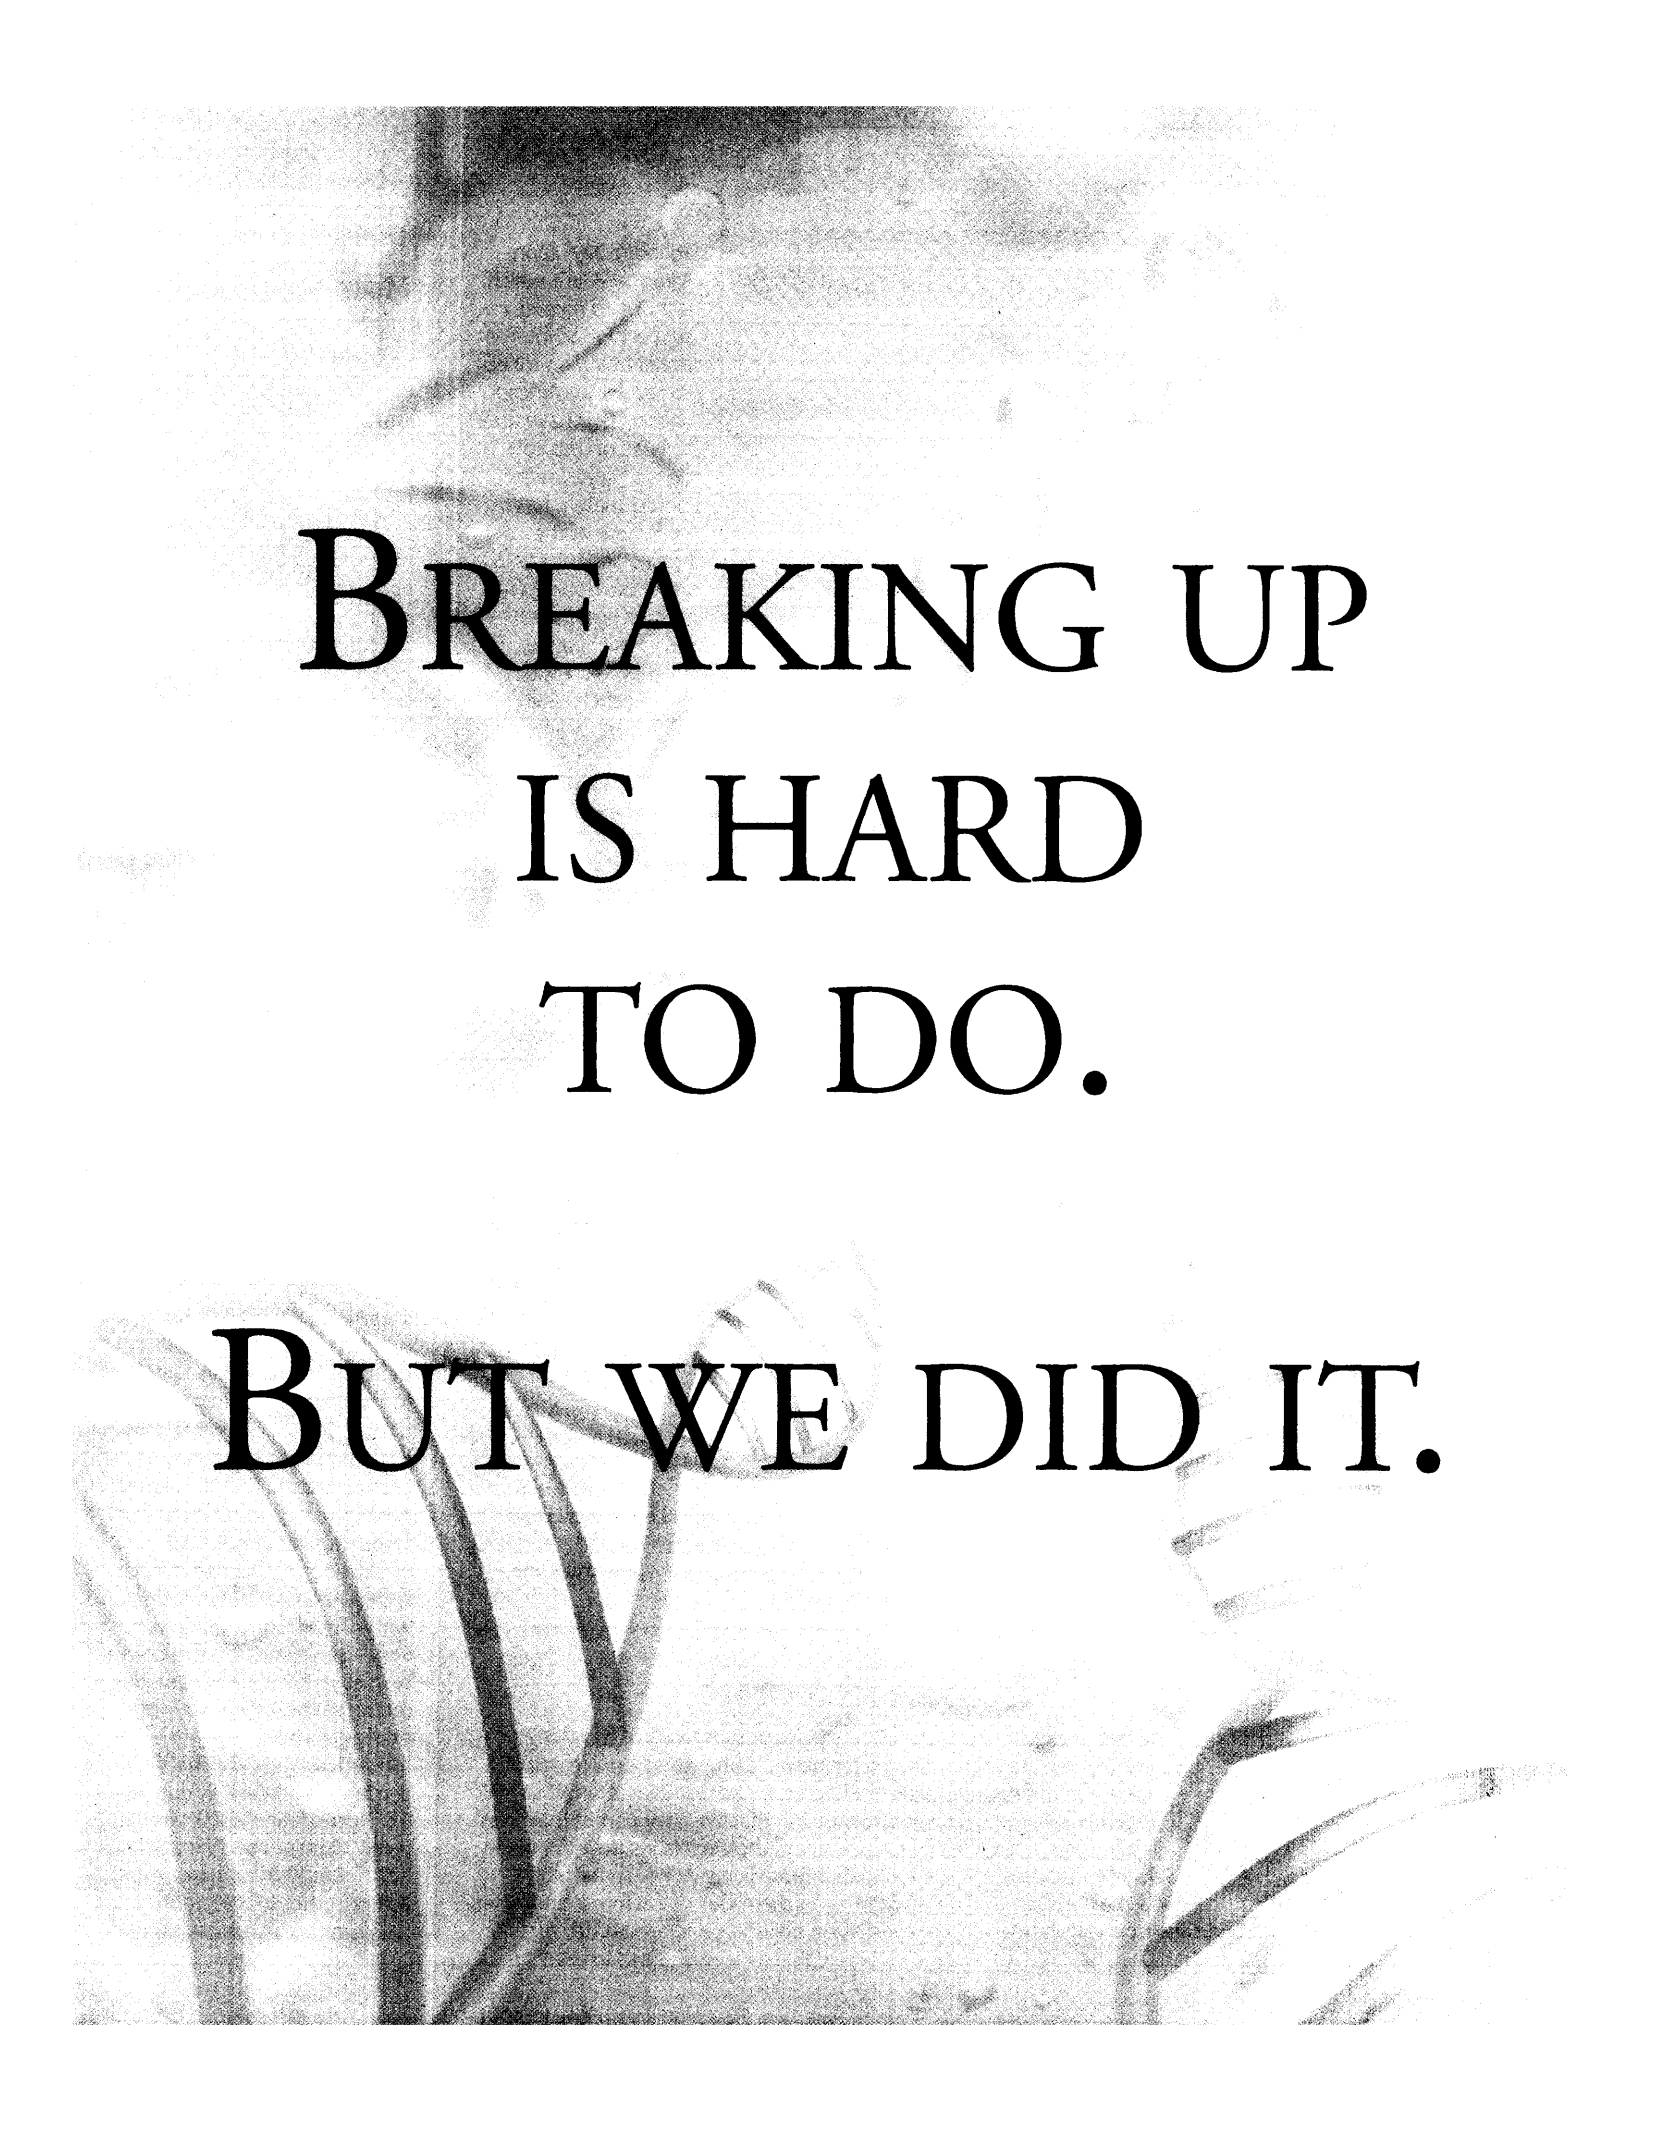

Yet, we have only begun to tap the potential. In the future, we can expect researchers throughout the world to become fluent in the language of genetics, for the benefit of us all.

BREAKING UP
IS HARD
TO DO.

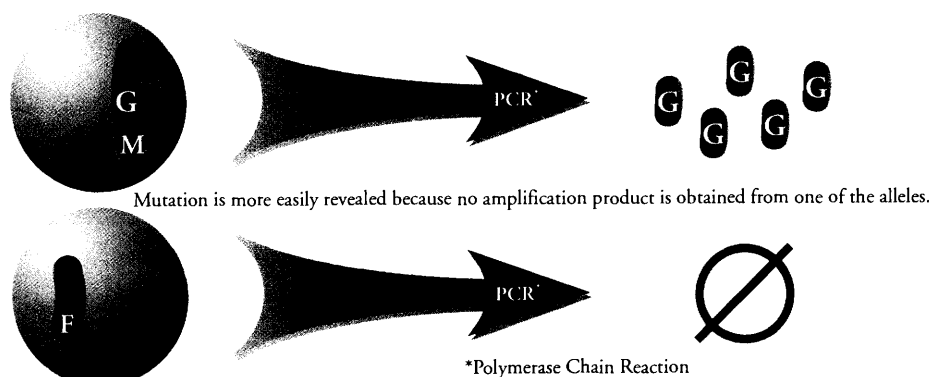

BUT WE DID IT.

INTRODUCING GMP CONVERSION TECHNOLOGY™

In conventional gene testing, the missing or mutated gene is often masked or completely hidden by the normal copy of the gene.

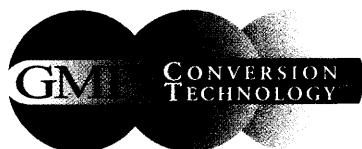

GMP CONVERSION TECHNOLOGY™ separates the two DNA sequences so they can be individually analyzed. The result: the mutation or deletion can more easily be detected.

GMP CONVERSION TECHNOLOGY™ is a diploid to haploid sample preparation process that separates genes into two differing natural forms as inherited from each parent. Published studies suggest that genetic testing on haploid samples detects abnormalities associated with certain hereditary diseases nearly 100% of the time.

Our technology, licensed from The Johns Hopkins University School of Medicine, is not a genetic test, nor is it a substitute for the many advanced methods available to search for mutations. Rather, it is a powerful new tool that dramatically increases the accuracy of genetic analysis and testing.

Annual Meeting & Science Innovation Exhibition

*Building the Future through Science,
Engineering and Technology*

FEBRUARY 15-20 : 2001 ► SAN FRANCISCO : CA

www.aaas.org/meetings

What They're Saying...

"As a first time AAAS meeting attendee I found the meeting to be **stimulating** and **exciting**."

*Richard A. Weibl, Association of American Colleges
& Universities and Council of Graduate Schools*

"My gratitude to all at AAAS for putting together such a successful meeting. The press briefing on [our symposium] has had an **unbelievable impact worldwide!** The story... has been carried by the Associated Press, Reuters, Knight Ridder and many other independent news media, and it has made it into just about every **newspaper** across the U.S., Europe, and some of the countries in the Pacific Rim. In addition, there have been BBC and CBC **radio broadcasts**, and CNN, ABC, and MSNBC **reports**."

*Professor Tasios Melis, UC-Berkeley
Participant in the symposium "Photosynthesis and
the Production of Renewable Hydrogen"*

**Don't miss out on the 2001 AAAS Annual
Meeting! Visit the web for more information.**

Which Would You Choose?

Gene Discovery Tool:

Gene Stalker™ cDNA Arrays ... 3 hours or,
Northern Blot 96 hours

Powerful

- Screen panels of Clonetics® Normal Human Primary Cell Strains simultaneously
- Detect low copy transcripts over 9 Kb
- TaqMan™ assay provides exact copy number of β -actin cDNA in each well
- Detect alternatively-spliced transcripts

Fast

- PCR from single strand cDNA and run an agarose gel

Economical

- \$ 27.⁰⁰ per column vs. \$ 87.00 a Northern Blot Lane

Put time on your side.

Call 800-341-1574

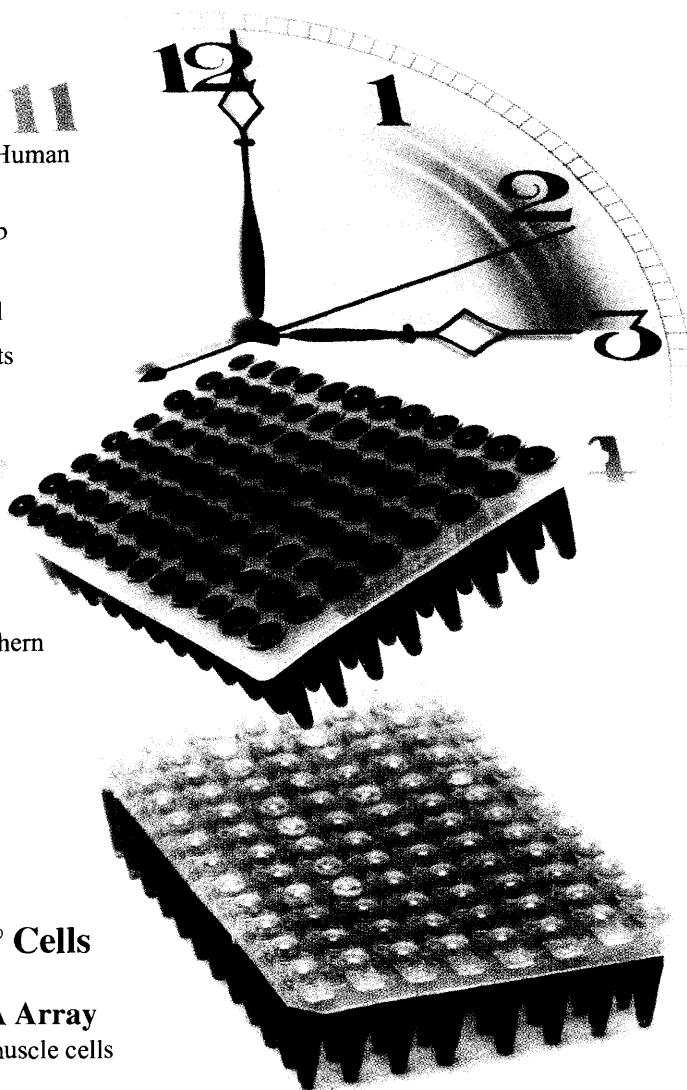

today and ask about:

cDNA Arrays of Clonetics® Cells

- MB-5200 Gene Stalker cDNA Array of separate endothelial and smooth muscle cells
- MB-5210 Gene Stalker cDNA Array of separate epithelial and dermal cell types

Other Gene Discovery Products

- Relevant Clonetics Cell Culture Systems
- Gel analysis products using BMA agarose gels, stains and markers

MERGEN LTD.

Discover A Clear Array of Possibilities. ExpressChip™ DNA Microarrays from Mergen.

If you need to simultaneously analyze over one thousand gene expressions, there's no better choice than ExpressChip™ DNA Microarrays from Mergen. Each ExpressChip kit contains two duplicate glass slides pre-spotted with oligonucleotides, and reagents for probe hybridization and signal amplification.

ExpressChip 

Simple, Flexible and Affordable.

- Choose among human, mouse, rat, or custom ExpressChip kits
- Use low amount of total RNA as starting material
- Process slides with your choice of laser scanners and image analysis software
- Customized services available

High Quality.

- Off-chip oligo synthesis for high coupling efficiency and optimized quality control
- Sequences individually tested for cross-homologies in GenBank database
- Superb spot geometry and uniform density
- Hybridization without cover slip for clear images across the array with minimal artifacts

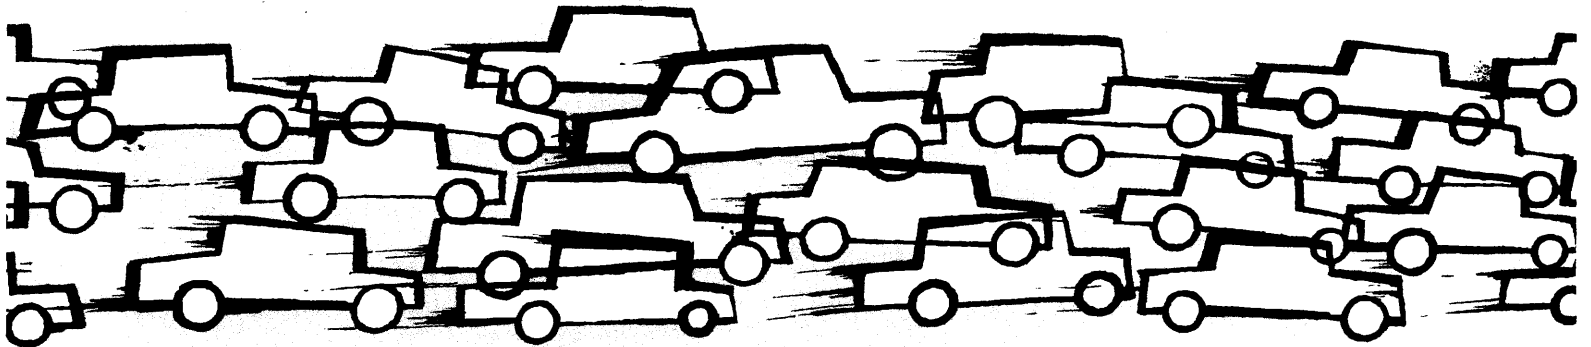

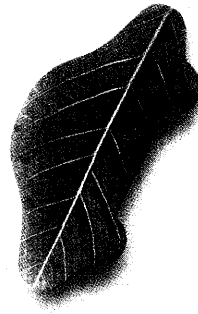

Differential Expression Results You Can Trust.

- High specificity and sensitivity
- Linearity over large dynamic range

Get started today with ExpressChip™ DNA Microarrays from Mergen and discover an endless array of possibilities. Visit us on the web at www.mergen-ltd.com, or call us toll-free at 1-877-4MERGEN (463-7436).

Going our way?

It's time to take cars in a new direction. Along a cleaner, more open road that travels the outskirts of convention. That's why we've created the Toyota Hybrid System, the power inside our breakthrough gas/electric vehicle, the Prius. Toyota is the first company to mass-produce a hybrid vehicle, and we're working to develop even more advanced technologies down the road. Fasten your seatbelts. It's going to be an exciting ride. www.toyota.com/ecologic 800-GO-TOYOTA ©2000

It Took **Years** to Complete the Research, **Months** to Write the Paper, and **Seconds** to Create the Bibliography.

EndNote 4 is a brand new version of the world's most popular bibliographic software. More than 250,000 researchers, scholarly writers, and students use EndNote to search online bibliographic databases, organize their references, and create bibliographies instantly and automatically. And now, with EndNote 4, researching and writing is easier than ever before!

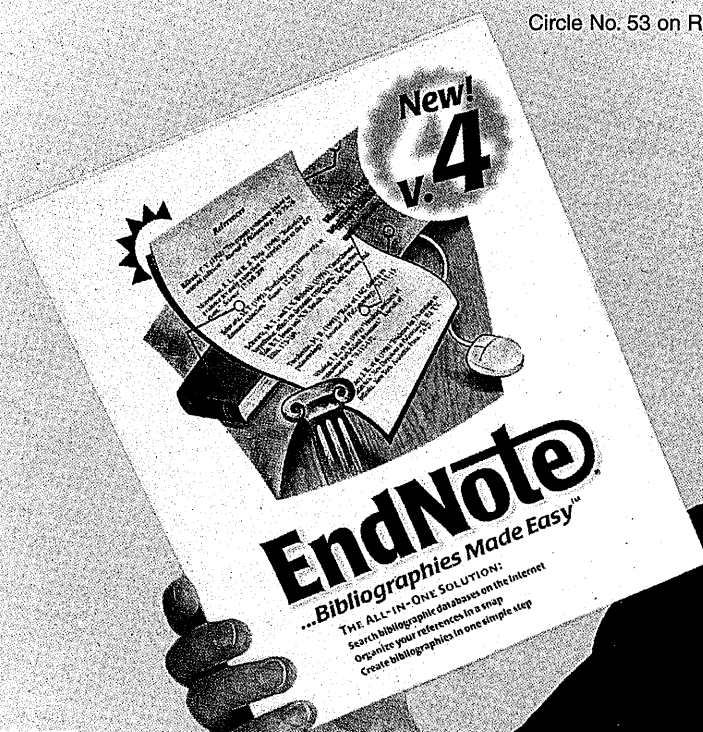

- Customize your reference display. Click-sort column headings, choose fields to view, and preview formatted references in hundreds of styles.
- Toolbars, drag and drop, and contextual menus allow for easy navigation and data management.
- Search Internet databases such as PubMed and BIOSIS from within EndNote and save search strategies for later use.
- Create one-step bibliographies in Microsoft Word and WordPerfect with advanced bibliographic details (e.g. grouped references, text notes in bibliography, anonymous works).
- Includes more than 400 journal styles (e.g. Science, APA, Cell)

PCR clean-up.

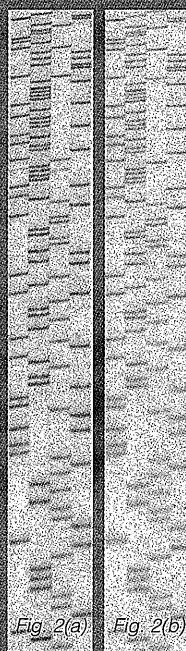

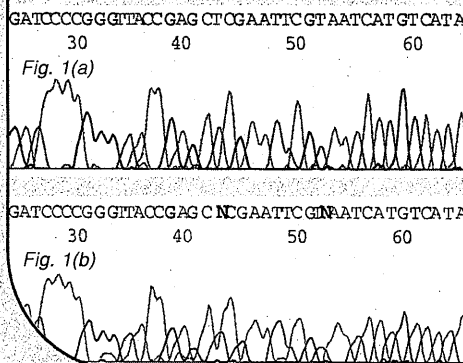

Why waste
time with it

when you can

ExoSAP-IT.

Fig. 1. Fluorescent sequencing results of a 100 bp pUC18 PCR fragment sequenced with a -20 Fwd primer using the DYEnamic ET Terminator Cycle Sequencing Kit (Amersham Pharmacia Biotech). Data generated for USB by Cleveland Genomics (clevelandgenomics.com), a research service company. PCR clean-up performed with: (a) ExoSAP-IT; (b) a column designed for PCR clean-up. Base miscalls in (b) are due to inherently low yields of short PCR products when using columns.

Fig. 2. Autoradiograms of a 20.7 kb Lambda PCR fragment sequenced with MBL202 Fwd primer using USB's Thermo Sequenase Radiolabeled Terminator Cycle Sequencing Kit. PCR clean-up performed with: (a) ExoSAP-IT; (b) a column designed for PCR clean-up.

- One Tube/One Step PCR clean-up
- 100% recovery of both small and long PCR products
- Economical for high throughput purification
- Less hands-on time than other methods
- Scaleable to handle large volumes

usb
Rediscover the chemistry™

Need an easy way to clean-up PCR[†] products, especially before sequencing? Without using a column or beads? And, without losing product? USB has a solution. Just ExoSAP-IT^{™‡} using Exonuclease I to degrade primers, and Shrimp Alkaline Phosphatase to degrade the dNTPs - both enzymes in one tube. A single pipetting step is all it takes to treat the PCR template. Just add ExoSAP-IT to your PCR product and within 30 minutes, sequence with either fluorescent or radioactive reagents.

To purchase outside the United States, please contact USB's authorized distributor, Amersham Pharmacia Biotech. Please visit our website at www.usbweb.com for regional information.
