AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

# Accept nothing less than a full-length finish.

Put an end to truncated RACE products with GeneRacer™.

You have some gene sequence but not the 5' end. Don't bet on conventional RACE methods to find your 5' end. They often produce mixed results and typically yield the truncated sequence you already have. Only the GeneRacer™ Kit eliminates truncated sequences. You'll get your results faster and obtain the full length you need to get ahead in the race.

#### GeneRacer™ Results

Clear, single bands  
after one round  
of 30-cycle PCR.

**Full-length lead.** The advanced GeneRacer™ method specifically targets full-length 5' capped mRNA. Only

full-length messages are transcribed and amplified, eliminating truncated sequences from your final results. You'll see a clear single PCR product, saving you time in analysis. *Get the 5' end and a full-length finish.*

Call Invitrogen today.

## COVER 2594

False-color image of plant life on Earth as observed from space with the Sea-viewing Wide Field-of-view Sensor (SeaWiFS). On land, greens indicate abundant vegetation, and tans show relatively sparse plant cover. In the oceans, blue areas are the least biologically productive, whereas green, yellow, and red areas represent progressively greater productivity. Since September 1997, SeaWiFS has measured light absorption by land plants and phytoplankton chlorophyll biomass in the oceans, providing a basis for quantifying biospheric photosynthesis. # Radiochemicals: It's serious business for us, too

**But we still provide ultimate sensitivity when working at molecular level. And with 60 years' dedication to supplying customers with the number one choice in radiochemicals, we've never been more serious about the business.**

Today, we offer you more than just a truly comprehensive range of quality products. Ordering is simple and our fast and reliable worldwide delivery service means you get what you want, when you want it.

When you need to know more about specific applications, you can call for expert technical support from our dedicated radiochemical specialists. And we go even further: our specialists can provide training programmes and additional customised support for RPOs and RSOs.

Whatever it takes. If you can think of a way of making a great service even better, then let us know. You bet we're serious about this business.

For more information, visit: [www.apbiotech.com/radiochemicals](http://www.apbiotech.com/radiochemicals)

*A tradition of excellence

PERSPECTIVE: **The Advantages of Togetherness** E. Cox and J. Bonner

The evolution of ATP-producing pathways provides clues to the origins of multicellularity.

## TECHNICAL COMMENTS

**Subatomic Features in Atomic Force Microscopy Images**

Using "a force-detection scheme with superior noise performance and enhanced sensitivity to short-range forces," Giessibl *et al.* (Reports, 21 July 2000, p. 422) reported that they could resolve subatomic features on a silicon surface with atomic force microscopy. Hug *et al.* comment that the frequency shift ( $\Delta f$ ) at which the experiments were performed suggests that "more than 95% of  $\Delta f$  is due to long-range ... forces," at variance with the claim of an enhanced sensitivity to short-range forces. Hug *et al.* conclude that the structures observed by Giessibl *et al.* were actually due to feedback artifacts. Giessibl *et al.* respond that "both theoretical and experimental considerations argue against" a feedback explanation and present additional topography and error signal data that "show clearly that feedback tracking errors are negligible."

The full text of these comments can be seen at [www.sciencemag.org/cgi/content/full/291/5513/2509a](http://www.sciencemag.org/cgi/content/full/291/5513/2509a)

# THIS WEEK IN Science

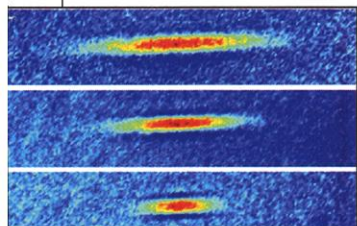

edited by Phil Szuromi

## Bosons Help Cool Fermi Gases

Evaporative cooling of an atom gas of bosons, whereby the hottest atoms are progressively removed, is an effective and widely used method for forming Bose-Einstein condensates. For Fermi gases, however, collisions between identical fermions are forbidden, and new tricks, such as mixing two Fermi gases with different spin states, have been used to form Fermi condensates. Truscott *et al.* (p. 2570; see the Perspective by O'Hara and Thomas) now create quantum-degenerate Bose and Fermi condensates simultaneously from a boson-fermion mixture. Heat is removed from the fermions through elastic collisions with the bosons, a process called sympathetic cooling. They show that different statistics associated with the two types of gases can actually be visualized. **X**

## Mapping Out Bond Formation

Several atomic force microscopy (AFM) studies have determined the force necessary to rupture a chemical bond. Lantz *et al.* (p. 2580; see the Perspective by de Lozanne) have used low-temperature, high-resolution AFM to map out the change in force versus distance for the formation of a chemical bond at a surface. Their atomic-resolution studies of the interaction of a single atom at the end of a silicon (Si) tip with different adsorption sites on the Si(111)  $7 \times 7$  reconstructed surface allowed them to determine the change in short-range chemical force with distance from the surface.

## Tharsis Rise and Water Fall

The Tharsis rise on Mars is a region of thick crust and high topography related to voluminous volcanism and includes the largest volcano identified in our solar system, Olympus Mons. Phillips *et al.* (p. 2587) have produced a model of the effect of the localized mass load of the Tharsis rise on the global geoid and topography that is consistent with data from Mars Global Surveyor. Their results suggest that the Tharsis rise was formed between 4.0 to 3.6 billion years ago and that about half of the valley networks may be related to hydrologic processes. The release of CO<sub>2</sub> and water during this intense period of volcanism may have produced a wetter and warmer martian climate. **X**

## Signs of Hydration

The isotopic composition of oxygen in atmospheric CO<sub>2</sub> is determined largely by the interaction of CO<sub>2</sub> and liquid water in the ocean, in soils, and in the leaves of plants. Because of the role of

## 2573 Magnetic Frustration

When a current is passed through a metal or semiconductor in the presence of a magnetic field, carriers deflected from their trajectory generate an electric field transverse to the direction of current flow that leads to the voltage drop known as the Hall effect. Measurements of this Hall effect for some magnetic materials—particularly spin-frustrated systems—have revealed an anomalous Hall effect in which the change in transport parameters are opposite to those found for normal materials. Taguchi *et al.* (p. 2573) combine experimental data from neutron scattering and transport measurements with theoretical work to suggest that geometrical (Berry phase) and spin-chirality effects are responsible for the anomaly.

leaf water, oxygen isotopes contain important information about the sources and sinks of atmospheric CO<sub>2</sub>. Gillon and Yakir (p. 2584; see the Perspective by Woodward) show that variations in the activity of the enzyme carbonic anhydrase, which catalyzes the hydration of CO<sub>2</sub>—and its equilibration with leaf water—in plants cause a wide range of CO<sub>2</sub> oxygen isotopic fractionation in different types of vegetation. This information could lead to better estimates of the relative contributions of C<sub>3</sub> and C<sub>4</sub> plants (defined by their use of the two major photosynthetic pathways) to global productivity. **X**

## Alignment Without the Rub

The application of liquid crystal (LC) materials to display technology is often limited by the ability to design and produce a substrate that can generate the desired surface alignment. Most techniques for generating substrates, such as rubbing, create rough textured surfaces that lead to defects in the orientation of the LC. Lee and Clark (p. 2576) have used smooth neighboring substrates that have different surface treatments to control the LC without any of the angular orientational degeneracies that usually accompany planar isotropic surfaces. Surface treatment was achieved by using self-assembled monolayers that were exposed selectively to ultraviolet light to alter their surface characteristics. More complex devices could be produced through microcontact printing.

## First Glimpse from SeaWiFS

The Sea-viewing Wide Field-of-view Sensor (SeaWiFS) has been orbiting Earth for 3 years, gathering data on global fluctuations in oceanic and land photosynthesis (net primary production, or NPP). This period included an El Niño-to-La Niña transition, and Behrenfeld *et al.* (p. 2594; see the cover) report that substantial increases in oceanic chlorophyll levels were observed that indicate a shift in nutrients available to phytoplankton. No corresponding increase was seen for land plants, but overall NPP from 1997 to 2000 was estimated to have increased by 4.5%.

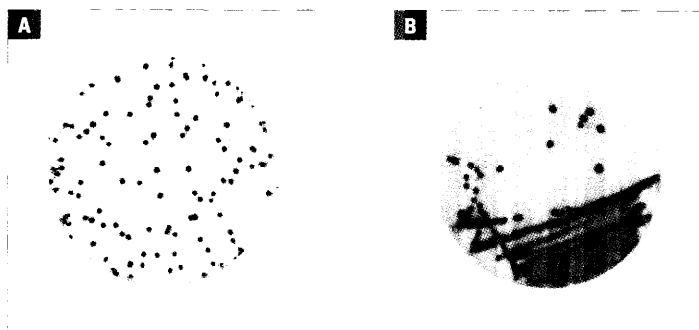

## Disrupted Schedules

A potential impact of global climate change is a shifting of seasonal changes. Thomas *et al.* (p. 2598; see the news story by Pennisi) expose the energetic and fitness costs that birds (in this case, blue tits in Corsica) incur when breeding is not perfectly synchronized with food availability in the local environment. Foraging costs increase as breeding becomes mismatched with food supply, which forces the parents to work beyond their sustainable

# Haven't You Poured Enough Plates?

**CLONdisc™ Plates—Made with Petrifilm™ Plate Technology**

Illustration is purely technical. Not for use as a reference.

**Panel A** shows a typical CLONdisc plate inoculated with an aliquot of bacterial culture. **Panel B** shows a single colony streaked on a rehydrated CLONdisc plate. *Lac*<sup>+</sup> colonies appear blue due to the presence of X-gal in the growth matrix. *Lac*<sup>-</sup> colonies appear red due to the presence of TTC. Both images were obtained using an Epson 836XL flatbed scanner.

The CLONTECH CLONdisc plate is a ready-made, wafer-thin culture medium system that contains a dehydrated nutrient medium, a cold-water gelling agent, and indicators for *lac* +/- differentiation. With an 18-month shelf-life and the option of adding any antibiotic to your diluted *E. coli* culture, CLONdisc plates replace agar plates for virtually all molecular biology applications. CLONdisc plates dramatically reduce cost, storage space, incubator space, and waste.

CLONdisc plates simplify the bacterial plating process to three steps: inoculate, incubate, and pick. Using CLONdisc plates means:

- No weighing or mixing of agar and media
- No microwaving or autoclaving
- No contaminated or expired plates
- No worry about having the wrong antibiotic
- No waiting
- And ... no pouring plates!

maximum metabolic rate and leads to low survival. These findings provide mechanistic detail for the selective forces acting on the timing of breeding in birds and have implications for the responses of birds to global climate change.

### Mutating Mutators

When bacteria reach the gut of a new host, they must adapt rapidly to these new conditions. Giraud *et al.* (p. 2606) have analyzed the advantages and disadvantages of the ability of the ubiquitous gut commensal, *Escherichia coli*, to accelerate mutation rates while colonizing the guts of germ-free mice. Although mutator populations were established in a new mouse and became dominant more quickly than strains that do not have the potential to generate adaptive mutations so rapidly, in the long term, mutators lose their advantage because it is too risky to maintain a high mutation rate. Although only neutral or beneficial mutations will be selected in the gut, any of these may become disadvantageous when the bacteria are flushed out of the gut and are exposed to a different environment before finding a new host.

### How Practice Makes Perfect

During a period of a few months, young songbirds listen to adult birds singing, begin to produce their own unpolished and fragmentary sounds, and gradually hone their skills until they, too, become master singers. How these skills are learned has been difficult to understand. Tchernichovski *et al.* (p. 2564; see the Perspective by Margoliash) have developed a training regimen in which they can record songs throughout the learning period. They then applied a sophisticated analysis that makes it possible to track from the final, polished song backward to the off-key and monosyllabic precursors. They find, for example, that when the target tone is slightly lower in pitch than the precursor, the young songbird increases the pitch of its note until an abrupt halving of the frequency puts it precisely on-key. 

### Fat-Burning Mice

Malonyl-coenzyme A is a key regulator of fatty acid metabolism in mammals and is generated by the action of two acetyl-coenzyme A carboxylases, ACC1 and ACC2. Abu-Elheiga *et al.* (p. 2613; see the Perspective by Ruderman and Flier) show that mice deficient in ACC2 are fertile and have a normal life-span but also exhibit a persistently elevated rate of fatty acid oxidation. The mice can consume normal amounts of food but store only half the amount of fat as wild-type mice. The identification of ACC2 as a potential therapeutic target for obesity may come as good news to those humans who wish to lose weight without modifying their diet or exercise habits.

### Pathfinding Virus

The decision to begin eating requires the integration of a variety of motivational and metabolic signals emanating from distinct regions of the brain. DeFalco *et al.* (p. 2608) traced these neural pathways in a rodent model by creating a genetically modified herpes virus (that also encodes a green fluorescent protein) that replicated only in neurons that expressed a gene product of interest and in neurons making synaptic contact with the initially infected cells. They find that hypothalamic neurons expressing the leptin receptor or neuropeptide Y, two proteins known to be involved in the regulation of feeding, receive inputs from a number of different brain areas, including the amygdala, cortex, and other regions of the hypothalamus.

### Neighborhood Conflicts

Development and conservation are often competing goals. Balmford *et al.* (p. 2616; see the news story by Vogel) have looked at this competition in detail. They show that scattered reports of a link between human settlement and areas of high conservation value are supported for an entire continent (Africa); across 1° grid squares, species richness in four vertebrate groups is positively correlated with human density. This relation is intimately associated with primary productivity. The scope to avoid conservation conflicts is therefore limited because many high-density grid squares contain species that are found nowhere else. Hence, the pervasive conflicts between conservation and development are unlikely to be easily side-stepped.

# STKE PUTS YOU ON THE RIGHT PATH

**W**ith standard features like Connections Maps, Protocols, Reviews, and Perspectives, plus an extended list of helpful e-tools like *personalization options* and *interactive letters*, *Science's STKE* puts you on the right path for all the latest signal transduction knowledge.

Whether you are in an academic or industrial environment, *STKE* will suit all your needs. Even if you're not specifically involved in the field of signal transduction, we offer special features and options spanning multiple biological disciplines.

*STKE* is updated weekly and provides the perfect combination of quick summaries and full text access to research papers from 23 publishers and over 40 respected scientific journals. To subscribe to *STKE*, or for more information, visit *STKE* at [www.stke.org](http://www.stke.org) and click

*subscription information*, or contact AAAS at (202) 326-6417 or [membership2@aaas.org](mailto:membership2@aaas.org).

No one can know where new insights in signal transduction might lead you, but *STKE* will help you find the right path.

[www.stke.org](http://www.stke.org)

Applied Biosystems roots go back to the origins of PCR. We were instrumental in its development and remain the world's leading source of innovative PCR technology, with a growing line of products known for performance and reliability. Products like the new GeneAmp® Gold PCR Reagent Kit.

**Multiplex PCR in GeneAmp® PCR Gold Buffer vs. GeneAmp® PCR Buffer II**

aMultiplex amplification of a 300 bp and a 500 bp product from  $10^4$  copies of  $\lambda$  DNA template in either GeneAmp PCR Gold Buffer or GeneAmp PCR Buffer II, with a 10 or 3 minute pre-PCR activation step at 95° C as indicated.

Self-contained and ready for amplification, the GeneAmp® Gold PCR Reagent Kit comes with AmpliTaq Gold® DNA Polymerase, our premium chemical Hot Start enzyme with Time Release capability, our new and improved Gold buffer, and dNTPs —and the confidence that comes from working with Applied Biosystems. Tap into our expertise. For more information on the GeneAmp Gold PCR Reagent Kit, contact your Applied Biosystems Representative, call 650.638.5800, or visit [www.appliedbiosystems.com](http://www.appliedbiosystems.com).

**With roots this strong,**

**we can't help but grow.**

# Discover the Knowledge Environment advantage

stke...

puts you on  
the right path.

**www.stke.org**  
Signal Transduction Knowledge Environment

**Research Highlights** Save time and stay on top of the field. The STKE editors provide quick summaries of the week's most outstanding papers in This Week in Signal Transduction.

## **Perspectives and Reviews**

Discover new insights on important research findings and learn how they impact your research. STKE's web-only format allows Updates to reviews, reader commentary in associated Letters, and on-line glossaries.

**Full Text Access** The Virtual Journal has up-to-date signal transduction research from over 40 journals.

**The Connections Map** Get your bearings with maps of signaling pathways derived from a unique and growing database of signaling components and their relations. Explore a new way to understand PI 3-kinase signaling. More pathways are coming soon.

**Personalization** Do more than you can with a "paper journal." Keep track of your last visit and what journals you've accessed. Use convenient Filters to get your own personally updated table of contents, so you never miss an issue. STKE Alerts can notify you by e-mail when papers are published on topics you've selected, and Folders provide fast, easy storage for items of interest.

**Protocols** STKE brings you step-by-step instructions for new and unusual techniques. Examples include aiming a "Gene Gun," production of cell-permeable peptides, and FRET analysis of protein-protein interactions.

# Introducing **CELERA DISCOVERY SYSTEM™**

*Celera's definitive, consensus Human Genome establishes the framework for research... Now discovery begins.*

Celera provided the foundation for future biomedical discovery by sequencing the:  
■ **consensus Human Genome** ■ **consensus Mouse Genome.**

To access these and other invaluable resources, we bring you a fully integrated discovery system that makes it easy to visualize and analyze Celera's genomic and biomedical information, as well as GenBank and multiple other sources.

Imagine. Through one system, you can leverage Celera's super-computing power, scientific know-how and fully integrated databases to expand the capacity of your existing R&D infrastructure. Accelerate your ability to identify genes, genetic variability, phenotype-genotype relationships and their connection to disease and therapeutics with the Celera Discovery System.

**Visit [www.accelerate.celera.com](http://www.accelerate.celera.com) to see our discovery system at work.**

## **Celera Discovery System Integrates the World of Genomics**

Advances in high-throughput techniques for sequencing, investigating mRNA expression, protein-protein interactions and proteomics are generating ever-increasing amounts of data. The Celera Discovery System has the power and ability to integrate a broad set of data including:

■ Celera's exclusive genomes ■ GenBank and multiple other sources ■ gene indices  
■ ontologies ■ protein motifs and domain databases ■ sequence trace files ■ SNP data, and more.

Relationships between these data are defined through pre-computed similarity searches, domain searches, protein classification and the identification of orthologs and paralogs.

Combine Celera's genomic and biomedical data with Celera's computational tools and super-computing power and you get a **bioinformatics infrastructure right at your desktop.**

***Celera can help you validate genes already "identified" by ESTs by mapping them to Celera's Human Genome.***

***Australia, Germany, Israel, Japan, Sweden, the United States... biomedical researchers around the world already subscribe to Celera.***

### **The Most Complete Assembly of the Human Genome**

Celera's human assembly provides the most comprehensive and accurate view of the Human Genome. Using approximately 5x of Celera human sequence data combined with BAC data from GenBank, Celera's ordered and oriented Human Genome is the most accurate and complete. Celera's Human Genome establishes the genomic context to discover novel and full-length genes and regulatory regions. It is fully integrated into the Celera Discovery System which gives you the tools to analyze:

■ mRNAs ■ proteins ■ conserved genes, and more.

### **Ensuring Data Accuracy with Comprehensive Annotation**

Celera builds a comprehensive view of human genes, proteins and mRNAs through its on-going investment in computational tools and expert annotation. Exclusive computational programs generate uniform data for quick and easy target identification. In addition, our staff of expert annotators validate and refine transcript structures, predicted proteins and gene family assignments.

### **The Power of Mouse to Uncover Genes**

Celera has the only completed Mouse Genome. Our 4.5x sequence of three strains of mouse (129/SvJ, DBA/2J, A/J) provides the reference coordinate system for mouse research. In addition, Celera has identified millions of mouse SNPs. Celera's efforts to overlay the mouse and human genomes to produce a "humanized mouse" model will facilitate discovery of previously unidentified genes and regulatory regions.

### **2.8 Million Unique SNPs Mapped to the Human Genome**

The Celera SNP database is a powerful resource for selecting informative genetic markers that support and enhance gene discovery, drug targets, and toxicity profiling. Celera's SNP database contains 2.8 million unique Single Nucleotide Polymorphism (SNP) markers – the most comprehensive collection of human SNPs. Celera's SNP data are integrated, mapped to the Celera Human Genome coordinate system, and linked to mRNA, protein sequences and disease information.

**To demo the system visit  
[www.accelerate.celera.com](http://www.accelerate.celera.com)  
or call 1-888-545-8801.**

Published by the American Association for the Advancement of Science (AAAS), *Science* serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objectives are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, to advance education in science, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

# Open Your Eyes to the All New Mini-Prep

*Now you can purify 48 samples in just over one hour*

# 48

FOR AUTOMATED PLASMID  
DNA MINI-PREPS

The Mini-Prep 48 uses a revolutionary method of plasmid purification based on agarose gel electrophoresis and electroelution—all done automatically!

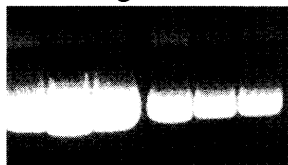

**HIGH PURITY** - FOR ALL YOUR FLUORESCENT AND MANUAL DNA SEQUENCING

**SIMPLE OPERATION** - BEGIN BY DIRECT LOADING OF CULTURE IN PRE-CAST SAMPLE CASSETTES

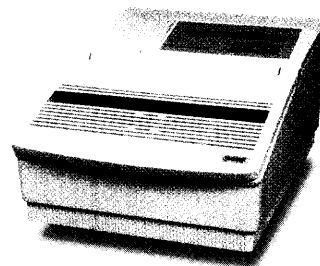

**COST EFFECTIVE** - LIST PRICE UNDER \$10,000

*Call now to open the door to a great time-saving instrument for your lab!*

**1-800-466-7949**

*You say 48 Yield is just too much for you?  
Well, our famous Mini-Prep 24 is still available.*

# ProofStart™ DNA Polymerase — a hot new concept for high-fidelity PCR

Current high-fidelity PCR

ProofStart PCR

## The new ProofStart™ DNA Polymerase offers

- **Robust performance** — hot-start modified enzyme to prevent primer degradation
- **High fidelity** — very low error rate
- **Minimal optimization** — built-in hot start and optimized PCR buffer
- **Easy handling** — reaction setup at room temperature

ProofStart DNA Polymerase uses a simple hot start procedure to eliminate primer degradation during setup — a problem with all other proofreading polymerases due to their exonuclease activity. A unique chemical modification of the ProofStart enzyme inactivates both

the 3'→5' exonuclease and the polymerase activity until you begin your hot start amplification. This makes ProofStart DNA Polymerase more robust than other proofreading enzymes, and gives you reliable, highly specific PCR — every time!

**For robust, high-fidelity PCR without the hassle, try ProofStart DNA Polymerase today!**

Trademarks: QIAGEN®, ProofStart™ (QIAGEN).

Products containing ProofStart DNA Polymerase are sold under licensing arrangements with F. Hoffmann-La Roche Ltd, Roche Molecular Systems, Inc. and The Perkin-Elmer Corporation. The PCR process is covered by U.S. Patents 4,683,195 and 4,683,202 and foreign equivalents owned by Hoffmann-La Roche AG. © 2001 QIAGEN, all rights reserved.

Background picture: computer-generated model of DNA molecule

## Ready, Steady, Go!

So you think your gradient PCR is complete and optimization of your protocol is now ready. Did you use SteadySlope Technology? You did? Then you really are ready to go and carry out your standard PCR application with the best results immediately.

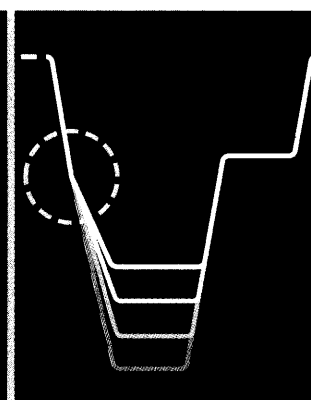

SteadySlope Technology is the golden way to ensure that all gradient temperatures are attained evenly, with optimum speed. For standard PCR applications, this is the highest possible ramp rate. This means the ramp rate is not artificially slowed down, which could have a negative impact on yield or specificity. The temperature-control characteristics in the gradient mode and during normal operation are identical, thus SteadySlope allows simple and precise transfer of experimental results to routine applications.

### **Mastercycler® gradient continues to set new standards in gradient PCR.**

- SteadySlope Technology: uncompromised transfer of protocols from optimization to routine
- Triple Circuit Technology: highest precision of all gradient profiles guaranteed by an additional temperature control zone
- Progress Upgrade: free download of new software from the internet as soon as it becomes available

**Mastercycler gradient with eppendorf SteadySlope Technology:** optimum temperature control characteristics during gradient mode

**Gradient cyler with "dynamic" heating and cooling technology:** changing temperature control characteristics (different cooling rates) during gradient mode

Comprehensive Longest-Clone Screening Service  
available. Call OriGene for more information.

### HOW RAPID-SCREEN WORKS:

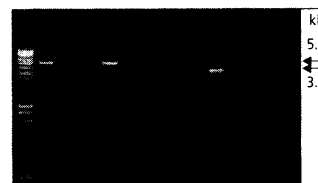

- Step 1:** Screen 96-well Master Plate by PCR (5000 clones/well; 500,000 clones/library)
- Step 2:** Screen 96-well Sub-Plate by PCR (50 clones/well)
- Step 3:** Single colony screen by PCR to identify final clone ( $\approx 1$  out of 50 colonies)

- Large cDNAs - insert size as large as 6-10 kb
- Expression Ready - clones contain CMV promoter
- Easy to use - no filter hybridization, no radioactivity
- Clone with confidence - final clones are not PCR products

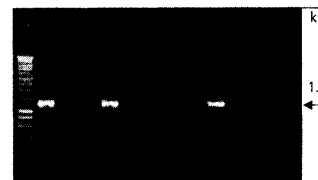

Know your insert size even before you proceed to isolate your clone of choice!

Master-Plate PCR screen using a pair of gene-specific primers to identify the positive pools (12 pools with 40,000 clones each)

Parallel screen using the 5' vector-derived primer and a gene-specific reverse primer to determine extent of 5'-end sequence.

Alternate screen using the 3' vector-derived primer and a gene-specific forward primer to determine extent of 3' sequence

Announcing the

GenePix 4000B

array scanner

# See more clearly

The GenePix revolution continues with the most advanced features yet available for array scanners.

**More resolution** Choose scan resolutions from 5 to 100  $\mu\text{m}$  for different sized features.

**More flexibility** Adjust the focal plane for alternative sample types such as thick samples, slides with a coverslip or membrane arrays.

**More accuracy** Laser power is dynamically monitored during scanning for constant signal output.

**More range** Adjust the laser power to optimize signal detection for a wide variety of sample types.

**More control** Control multiple GenePix scanners from a single computer for experiments requiring three or more colors.

**More choices** Choose from a full palette of laser wavelengths when placing your 4000B order: 409, 473, 532\*, 594, 635\*, 670, and 690 nm. \*Standard

**More applications** Scan protein arrays, tissue arrays, cell arrays, and more!

**Find out more.** To get more details and a list of international distributors, call +1-650-571-9400 or visit our web site at [www.axon.com](http://www.axon.com).

## More powerful analysis tools

The latest GenePix Pro software includes new and improved scripts for instrument validation, quality control and powerful data analysis.

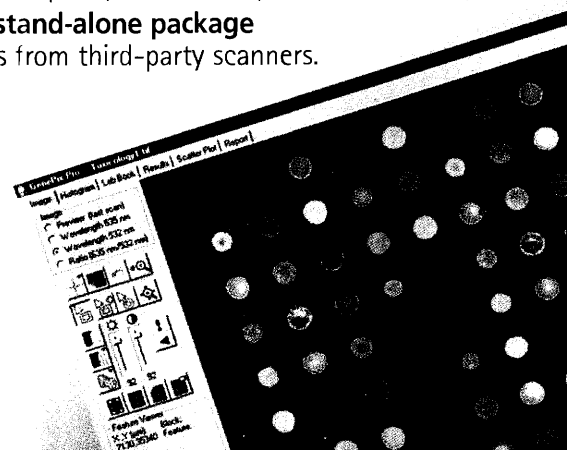

**Also available as a stand-alone package** for analysis of images from third-party scanners.

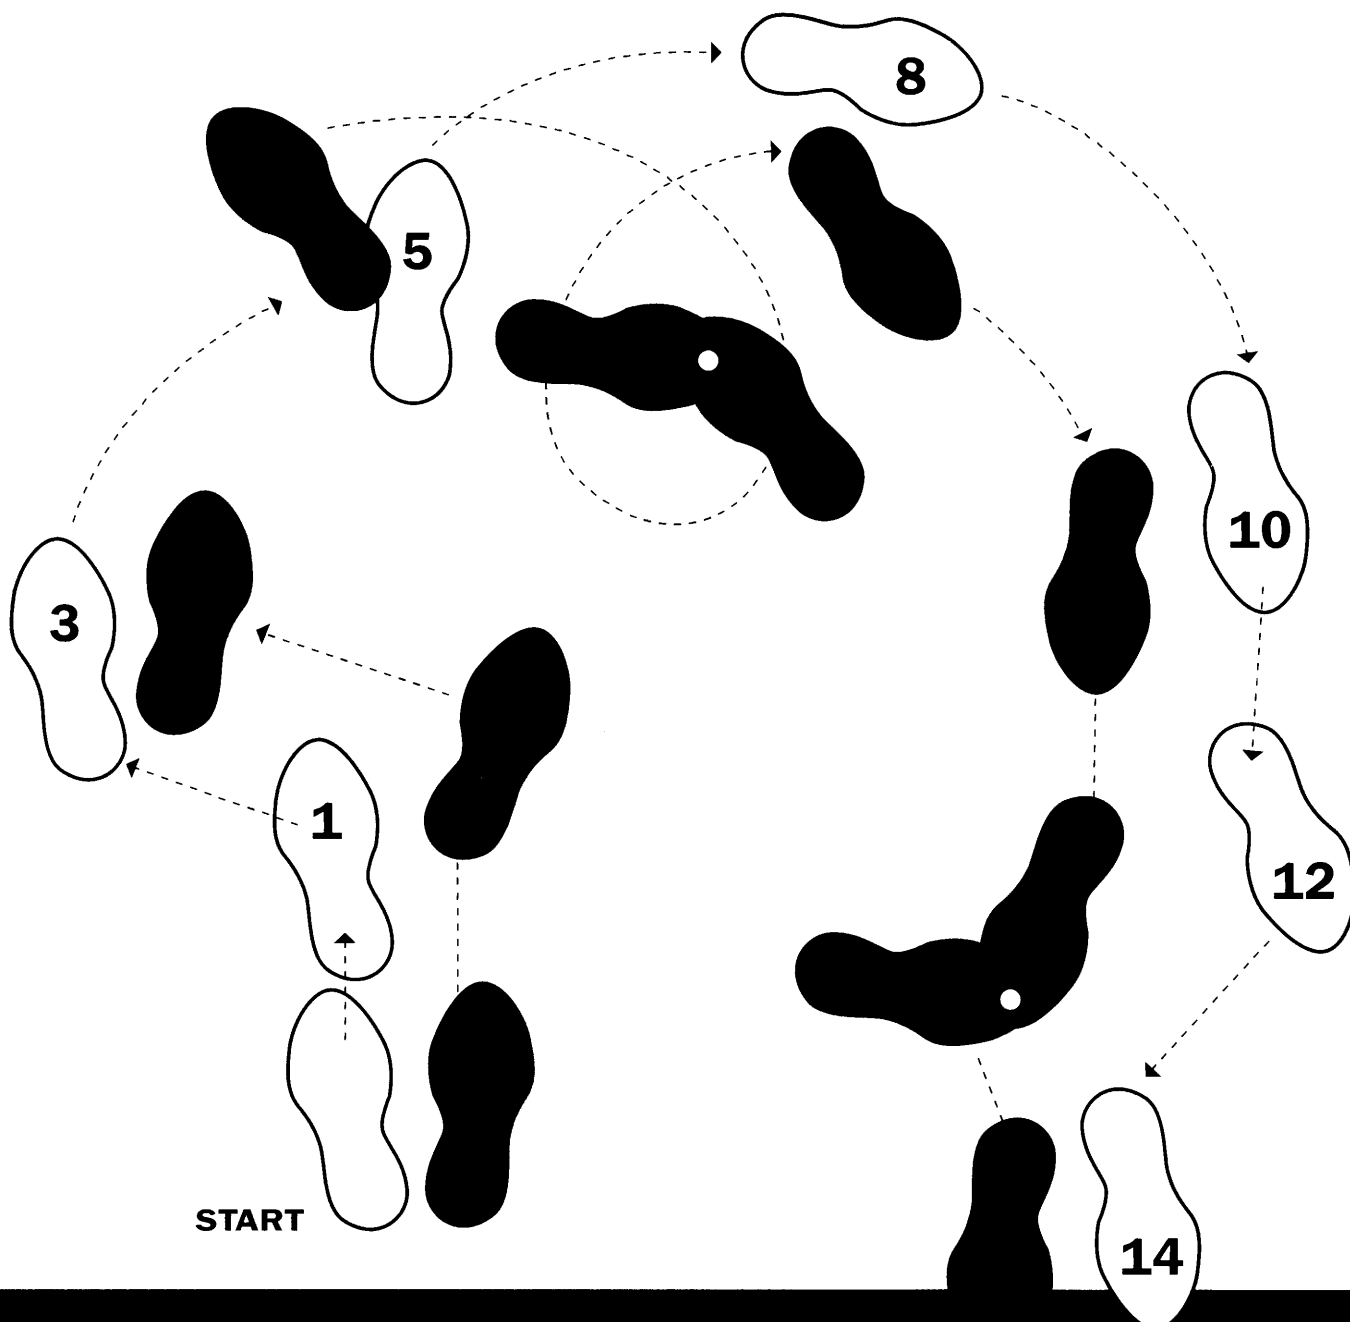

GenePix is a trademark of Axon Instruments, Inc. © 2001, Axon Instruments, Inc.

advances in the field of structural genomics. In the rapid screening of folded material, for example, NMR plays a major role in both the structure determination of difficult to crystallize targets and the ratification of sequence homology models. Recent developments in NMR spectroscopy are amenable to rapid analysis by advanced computer software, making it a method of choice for high-throughput screening and therapeutic design.

The first step in the NMR 3D structure determination is the assignment of all the chemical shifts of the macromolecule of interest. For this, even an experienced researcher requires a versatile software package that permits simultaneous analysis of several multidimensional heteronuclear spectra. FELIX is a software product containing built-in data processing macros and import filters, which process data acquired from any major NMR spectrometer. The package incorporates several options for baseline correction and solvent suppression, and it contains a powerful macro language that enables flexibility in processing data and ready implementation of NMR methodological advances.

FELIX can provide numerous views of NMR spectra. Contour plots of planes and 1D vector extraction from any 2D, 3D, or 4D spectra are also available. Peaks can be picked automatically, pruned interactively, and transferred between datasets. Although the software provides semi-automatic assignment of chemical shifts, it also has a fully automatic option for NMR spectral assignments relative to biological macromolecules. These include spin-system detection and identification. A broad range of NMR spectra could be analyzed this way, homonuclear 2D to heteronuclear 3D spectra for example, but substantial manual input is necessary to ensure a reliable result. Identification, tabulation, and interpretation of the nuclear Overhauser effect (NOE) by the software provides distance measurements essential for the final structure determination.

The approach used by FELIX is well refined and highly appropriate for a productive biological NMR laboratory. The program is expensive, particularly for an academic environment, but the software provides a comprehensive solution for the NMR structural biologists, from the processing of raw NMR data to chemical shift assignment and structure calculation. Although FELIX provides a practicable approach, good quality and less costly alternatives do exist.

## **FROM CHEMICAL SHIFTS TO STRUCTURES**

Nuclear magnetic resonance (NMR) spectroscopy is a powerful tool for determining the three-dimensional (3D) structures of biological macromolecules. Recent successes in genomics, together with technical advances in structural biology, have allowed for significant advances in the field of structural genomics.

In the rapid screening of folded material, for example, NMR plays a major role in both the structure determination of difficult to crystallize targets and the ratification of sequence homology models. Recent developments in NMR spectroscopy are amenable to rapid analysis by advanced computer software, making it a method of choice for high-throughput screening and therapeutic design.

The first step in the NMR 3D structure determination is the assignment of all the chemical shifts of the macromolecule of interest. For this, even an experienced researcher requires a versatile software package that permits simultaneous analysis of several multidimensional heteronuclear spectra. FELIX is a software product containing built-in data processing macros and import filters, which process data acquired from any major NMR spectrometer. The package incorporates several options for baseline correction and solvent suppression, and it contains a powerful macro language that enables flexibility in processing data and ready implementation of NMR methodological advances.

FELIX can provide numerous views of NMR spectra. Contour plots of planes and 1D vector extraction from any 2D, 3D, or 4D spectra are also available. Peaks can be picked automatically, pruned interactively, and transferred between datasets. Although the software provides semi-automatic assignment of chemical shifts, it also has a fully automatic option for NMR spectral assignments relative to biological macromolecules. These include spin-system detection and identification. A broad range of NMR spectra could be analyzed this way, homonuclear 2D to heteronuclear 3D spectra for example, but substantial manual input is necessary to ensure a reliable result. Identification, tabulation, and interpretation of the nuclear Overhauser effect (NOE) by the software provides distance measurements essential for the final structure determination.

The approach used by FELIX is well refined and highly appropriate for a productive biological NMR laboratory. The program is expensive, particularly for an academic environment, but the software provides a comprehensive solution for the NMR structural biologists, from the processing of raw NMR data to chemical shift assignment and structure calculation. Although FELIX provides a practicable approach, good quality and less costly alternatives do exist.

## **GENE SPEC III SPECTROPHOTOMETER**

The Gene Spec III spectrophotometer allows for greater sensitivity and precision than conventional spectrophotometers, while analyzing samples as small as one microliter within 8 s. The

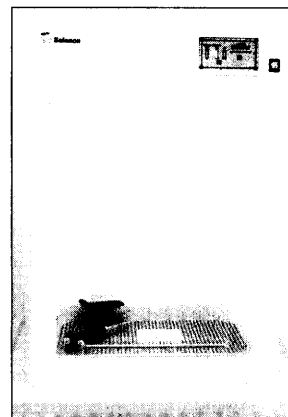

instrument scans and quantifies DNA/RNA and protein samples. It has specialized software for DNA/RNA measurement that measures absorbance, 260/280 nm ratio, concentration, and purity. Other capabilities include wavelength scanning, time scans, and quantitation. In as little as 8 s, it measures and displays samples and their results in a complete spectrum from 190 nm to 1100 nm. The 1024-element photodiode array technology allows for greater sensitivity, precision, and faster scanning than most spectrophotometers. Operations are controlled through a personal computer, allowing upgrades of the accompanying software and secondary processing of spectra.

## **PCR WORKSTATION**

The AirScience economy polymerase chain reaction (PCR) sterile-air unit offers all polypropylene construction, electronic airflow monitoring, and a reinforced glass sliding sash. It has dual electronically controlled ultraviolet lights with automatic shutoff in addition to twin fluorescent lights. The compact 23.5-inch by 23.5-inch footprint saves valuable bench space. Two integrated decontamination shelves and a stainless or polypropylene work surface complete the interior. The compact workstation offers Class 100 laminar flow high-efficiency particulate air filtration to 99.999%. It doubles as a vertical laminar flow workstation and can be used for metals analysis.

## **AUTOMATED DNA PURIFICATION**

The TECAN Genesis RSP Robot is a fully automated purification system that can process 96 samples in just 75 min. Once the purification procedure is started, no manual interaction is required. The robot is equipped with an eight-channel liquid-handling device, a vacuum filtration unit, and an arm tool that reassembles the vacuum manifold during purification. The basic purification process can be integrated with additional devices such as a plate reader or thermocycler, making the robot suitable for automating applications such as polymerase chain reaction.

## **PEROXIDASE SUBSTRATE**

FluoroBlot Peroxidase Substrate is a non-photobleaching, chemifluorescent substrate for the detection of peroxidase in blotting applications that is more stable than typical alkaline phosphatase chemifluorescent substrates. Like enhanced chemiluminescence, it allows for sensitive, subfemtogram detection. FluoroBlot gives high signal-to-noise ratios and allows for a broad, 5-log dynamic detection range of peroxidase activity. It can detect less than 1 pg of horseradish peroxidase in a dot blot and

## NEW PRODUCTS

has been shown to detect subfemtogram levels of a target protein in a protein immunoblot. Similarly strong results have also been obtained with Northern and Southern blotting applications.

### LIQUID CELL FOR CONFOCAL MICROSCOPE

A new liquid cell, when used with the Nanonics NSOM/AFM 100 Confocal Microscope, allows high power objectives to be placed above and below the aperture in the center of the microscope system. The liquid cell consists of a bath, in which the sample sits, and a tip mount, which is suitable for either Nanonics cantilevered optical fibers or standard atomic force microscopy silicon cantilevers. It has a clear optical axis. It permits all forms of AFM, including contact, noncontact, and intermittent contact in a liquid environment. The ability to keep the optical axis free from the top and the bottom of the liquid cell comes from patented cantilevered near-field optical elements and the optics of the NSOM/AFM 100 Confocal System.

### MICROBIAL GENETIC ANALYSIS

The EZ::TN Transposome Kits are a fast, easy, and reliable method to create gene "knockouts" in microorganisms and to facilitate microbial genetic analysis. The Transposome can be electroporated into a living cell, where it randomly inserts its transposon into the host's genomic DNA to create gene "knockouts" and phenotype changes. Then, it is possible to sequence up to 1000 bases surrounding the transposon insertion site, without cloning, using primers provided in the kits that are homologous to the ends of the inserted transposon.

### METABOLIC CAGES

New Metabolic Cages enable measurement of urine excretion, food and liquid consumption, animal activity, and  $VO_2/VCO_2$ . To allow animal exercise, an optional exercise wheel can be installed. Cages are available in sizes for rats and mice. Urine is collected through a special channel that directs the urine droplets to a container on a precision scale. Food consumption is measured through special feeders that feature a narrow tunnel that minimizes food spillage. The food cup rests on a precision scale that communicates with the computer. Animal activity is measured by a system of infrared beams. Oxygen consumption and carbon dioxide production are measured by an Oxyman metabolic computer, which periodically samples the air from the animal cages. Up to 16 cages can be combined into a Comprehensive Lab Monitoring System, with all data collected by a Pentium computer.

### IN VITRO TRANSLATION LABELING SYSTEM

The FluoroTect Green<sub>lys</sub> in vitro translation labeling system allows for the fluorescent labeling and detection of proteins synthesized in vitro. The system is based on a lysine-charged tRNA that is labeled at the epsilon position of the lysine with a fluorophore.

SEPSIS

ALZHEIMERS

ATHEROSCLEROSIS

DIABETES

NUTRITION

Fluorescent lysine residues are incorporated into synthesized proteins during in vitro translations reaction, eliminating the need for radioactivity. There is no requirement to transfer, fix, or dry gels.

#### BENCHTOP THERMOSTAT

The ThermoStat plus provides temperature control of all commonly used lab tubes. This compact, benchtop thermostat with Peltier technology can precisely maintain temperature levels up to 99°C, with a cooling facility for

temperatures as low as -5°C.

The autoclavable, exchangeable thermoblocks for 24 × 0.2-ml, 0.5-ml, 1.5-ml, or 2.0-ml tubes as well as for microtiter plates and deep-well plates provide a high degree of flexibility. A thermoblock is available for vials and beakers as tall as 60 mm. Up to four temperature levels and four time phases can be run through automatically in immediate succession.

#### KITS FOR IMMUNOFLUORESCENT STAINING

New ready-to-use immunofluorescence kits offer efficient and sensitive fluorescence detection of antibodies for immunohistochemical staining of cells

and tissues. Through the use of enhanced biotin-streptavidin detection technology that delivers high signal-to-noise results, the new kits provide high-resolution fluorescence staining of paraffin sections, cryostat sections, cell monolayers, and whole mounts. A choice of four streptavidin-conjugated fluorescent dyes is available: phycoerythrin (absorption 475 to 575 nm, emission peak 580 nm); FluorBlue (absorption 350 nm, emission peak 442 nm); FluorGreen (absorption 488 nm, emission peak 524 nm); and FluorRed (absorption 519 nm, emission peak 617 to 630 nm). A wide selection of biotinylated secondary antibodies is also offered, permitting the use of mouse, rabbit, rat, or goat primary antibodies.

#### LITERATURE

*Physitemp: Precision Temperature Specialists* is a 36-page catalog detailing a complete line of high-quality electronic thermometers, microprobes, and related accessories. A temperature measurement system using Physitemp thermocouple monitors and probes includes the advantages of adaptability to most situations, accuracy traceable to National Institute of Standards and Technology standards, tiny probes when required, fast response, high stability, interchangeability, and wide temperature range.

Newly offered instrumentation, apparatus, and laboratory materials of interest to researchers in all disciplines in academic, industrial, and government organizations are featured in this space. Emphasis is given to purpose, chief characteristics, and availability of products and materials. Endorsement by *Science* or AAAS of any products or materials mentioned is not implied. Additional information may be obtained from the manufacturers or suppliers named by circling the appropriate number on the Reader Service Card and placing it in a mailbox. U.S. postage is free.

## Legal Issues and Strategies for Responding to Allegations of Research Misconduct

May 30-31, 2001, Washington, DC

**J**oin your colleagues at a one-and-a-half day conference on legal issues and strategies in responding to allegations of research misconduct. Changes in regulatory policy and recent litigation regarding research misconduct have complicated the legal environment for the federal government, colleges and universities. This conference will help improve your understanding of policies, procedures and methods for responding to allegations of research misconduct and the rights and responsibilities of all parties involved.

Conference speakers included some of the most knowledgeable federal and institutional officials and private attorneys, all with first-hand experience in handling research misconduct allegations. Topics to be covered include the regulatory framework and interactive relationship between government and institutional policies, legal issues embedded in the inquiry; the investigation of research misconduct and appeals process; and issues surrounding litigation.

The conference is intended for an audience of university and medical school administrators and counsel, researchers, private attorneys, law professors and others interested in examining key legal issues associated with allegations of research misconduct and identifying strategies for effectively responding.

Registration is limited. Registration and other information can be found on the WWW at: <http://www.aaas.org/spp/legal> or contact Rachel Gray, AAAS, 1200 New York Ave., NW, Washington, DC 20005, Tel: 202-326-7016, Fax: 202-289-4950 or E-mail: [rgray@aaas.org](mailto:rgray@aaas.org).

Convened by the American Association for the Advancement of  
Science and the US Office of Research Integrity  
Co-sponsored with Howard University and Johns Hopkins University
