AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Quantitative gene analysis is now in sight.

Use I-SAGE™ and find your path
to gene analysis results.

Don't waste time running into dead ends on the path to gene expression analysis. Bring the power of SAGE™ technology into your lab with the I-SAGE™ Kit and see your way to quantitative, sensitive gene analysis results.

The Power of SAGE™ SAGE™, Serial Analysis of Gene Expression, is the most powerful, unbiased method for quantitative, genome-wide expression analysis. Unlike arrays, SAGE™ enables you to analyze every transcript in a cell, giving you a comprehensive expression profile. SAGE™ is quantitative and extremely sensitive so you can find low-abundance transcripts, detect up- or down-regulated genes, measure a compound's effect on expression, and identify novel genes.

The Path to Success. With the I-SAGE™ Kit, we've made SAGE™ significantly easier to implement. The I-SAGE™ Kit provides you with a complete set of pre-qualified, performance-guaranteed reagents. There's no sourcing, ordering, or testing reagents, saving you time and ensuring your SAGE™ success.

Set your sights on quantitative gene expression analysis with the I-SAGE™ Kit. For more information, contact Invitrogen today.

Universal Human Reference RNA

The Standard to Advance Microarray Research

- * **Standard for accurate and consistent data comparison**
- * **High-quality total RNA for microarray gene-expression profiling**
- * **Extremely large lot sizes ensure consistency between experiments**

Stratagene's Universal Human Reference RNA provides the microarray community with a high-quality standard to allow accurate and consistent evaluation and comparison of gene expression microarray experiments. Universal Human Reference RNA allows direct comparison of data from different experiments and between labs using the same reference.

Stratagene's Universal Reference RNA is composed of total RNA from a wide variety of human cell lines, providing broad hybridization coverage to genes on essentially all human arrays. Large lot sizes ensure consistency between experiments and stringent production procedures minimize lot-to-lot variability.

COVER 2269

In *Through the Looking-Glass and What Alice Found There*, the Red Queen complained that in Wonderland "it takes all the running you can do, to keep in the same place." She has thus become the name-sake of coevolutionary arms races in which plants continually adapt to retain resistance against their ever-evolving pathogens. The intricacies of the interactions between plants and their pathogens are explored in a special section beginning on page 2269. [David Galchutt]

Resource Needs for HIV/AIDS B. Schwartländer *et al.*

Schwartländer *et al.* provide estimates for the costs of preventing and combating HIV/AIDS internationally.

Coupled Transcription and Translation Within Nuclei of Mammalian Cells F. J.

Iborra, D. A. Jackson, P. R. Cook

Evidence that translation of RNA into protein can occur in the nucleus puts a firm dent in the dogma that translation occurs exclusively in the cytoplasm of eukaryotic cells.

Haplotype Diversity and Linkage Disequilibrium at the G6PD Locus: Implications for the Origins of Malarial Resistance S. A. Tishkoff *et al.*

Glucose-6-phosphate dehydrogenase deficiencies are common because they confer some resistance to malaria and appear to have evolved recently, within the past 1600 to 12,000 years.

Clinical Resistance to STI-571 Cancer Therapy Caused by BCR-ABL Gene Mutation or Amplification M. E. Gorre *et al.*

2231 Advanced-stage leukemia patients who relapse after treatment with the potent new drug STI-571 do so because their tumor cells reactivate the same Bcr-Abl signaling pathway that originally made the cells tumorigenic.

TECHNICAL COMMENTS

White Dwarfs and Dark Matter

Oppenheimer *et al.* (Research Articles, 27 Apr. 2001, p. 698) observed a population of faint, cool white dwarfs—the kinematics of which were consistent with membership in the galactic halo—and suggested that the population accounts for 2% of the halo's "dark matter." Gibson and Flynn present calculations to argue that the objects found by Oppenheimer *et al.* actually "have a local density that is a factor of 2 to 4 less than their claimed detection of 2%." Separately, Graff compares the group's findings with those of the Luyten Half Second (LHS) survey and concludes that, far from discovering a new population of halo dark matter, Oppenheimer *et al.* have "only rediscovered the white dwarfs of the [galactic] disk." Oppenheimer *et al.* respond that the Gibson and Flynn analysis rests on invalid assumptions and presupposes accuracies not permitted by the actual data. Graff's arguments "likewise do not withstand close scrutiny," they assert, in part because "our survey and the LHS are not directly comparable."

SPECIAL AD SECTION / 13 JULY ISSUE

LAB TECHNOLOGY TRENDS

Advances in Immunology and AIDS Research:

This special advertising section will focus on technologies used in AIDS research and will detail current areas of immunology. Look for it in the 13 July issue.

From Sample to Results in Less Than Three Hours

Perform nucleic acid purification and analysis more quickly and more precisely with MagNA Pure LC and the LightCycler Instrument.

Process samples faster: Isolate DNA, RNA, or mRNA in less than two hours, then view quantitative PCR results on-line only 30 minutes later.

Fully automate sample processing: Combine MagNA Pure LC, the LC Carousel Centrifuge, and the LightCycler Instrument to process samples with minimal "hands-on" time, freeing technicians for other research.

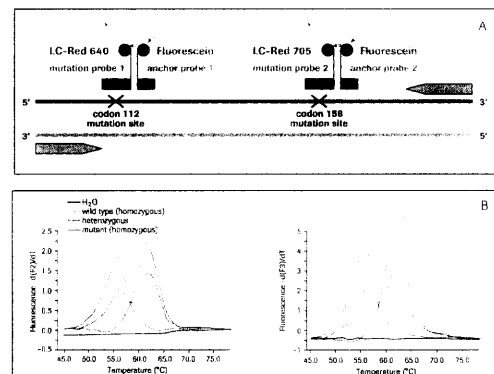

Achieve greater precision and flexibility:

Precisely control pipetting, reaction set-up, and thermal cycling temperatures to obtain more accurate, reproducible results.

For more information, visit our web site
<http://biochem.roche.com/lightcycler>
or contact us at (800) 428-5433.

Genomic DNA isolation from 32 samples of human whole blood using MagNA Pure LC. No visible intra-assay variance.

Dual-color genotyping using the LightCycler Instrument.
A. Schematic of the PCR. **B.** Melting curve analysis was performed on different genotypes at codons 112 and 158 of the Apo E sequence (in channels 2 and 3) to discriminate wild type, heterozygous, and mutant genotypes.

THIS WEEK IN Science

edited by Gilbert Chin

Lining Up Liquid Crystals

For most liquid crystal (LC) devices, the substrate for the device needs to be treated to induce a particular alignment of the LC at the surface. The standard procedure is to rub the surface, producing an alignment parallel to the rubbing direction. Stöhr *et al.* (p. 2299) use near-edge x-ray absorption fine structure (NEXAFS) spectroscopy to correlate the orientation bond order at the surface with various treatment methods. They find that any method that induces order at a carbonaceous surface can be used to generate a substrate, and that ion-beam irradiation of diamond-like carbon films can be used to replace rubbing and thus form the basis for the next generation of LC devices.

Acoustic Oscillations in Accord

A standard model of the evolution of the universe assumes that an initial inflationary phase was followed by a Hot Big Bang. This process created a universe full of ionized plasma during its first 100,000 years, and the competing interactions between photon pressure and gravitational pressure in higher density clumps created acoustic oscillations in the plasma. These acoustic oscillations left features in the cosmic microwave background (CMB), which represents a radio-wavelength remnant of the early universe, that were recently measured. Miller *et al.* (p. 2302) have analyzed the acoustic oscillations imprinted on the matter-density distribution of clusters of galaxies and individual galaxies formed in the recent universe and found that the oscillations are consistent with the CMB results. Thus, oscillations recorded in young galaxies match with oscillations recorded in the very old plasma and provide further support for the Inflationary Hot Big Bang model of formation of the universe. 

African Rains

The tropics are thought to be an important source of global climate variability, as well as an area whose response to climate change must be understood better in order to anticipate possible impacts of global warming (see the Perspective by Gasse). However, high resolution records of continental temperature and precipitation of this area are relatively scarce. Barker *et al.* (p. 2307) report results from oxygen isotopic analyses of silica from diatoms that lived in alpine lakes on Mt. Kenya and conclude that the changes in the amounts of rainfall and evaporation, rather than variations in temperature, were responsible for the important iso-

2310 Stomatal Matters

Global temperatures and the concentration of atmospheric CO₂ are remarkably well correlated over the past 400,000 years, and there is reason to expect that they also were correlated further back in time. However, proxy measurements of CO₂ for some warm intervals during the past 60 million years are grossly inconsistent, ranging from 300 parts per million (ppm) to more than 3000 ppm. Royer *et al.* (p. 2310) address this disagreement by estimating the concentration of atmospheric CO₂ with measurements of the stomatal density (a function of ambient CO₂ levels) of fossil leaves from warm intervals during the Miocene and the Paleocene/Eocene boundary. They find that CO₂ concentrations during these periods remained relatively low, mostly between 300 and 450 ppm, and that the amount of warming expected from the corresponding CO₂ forcing is much less than that which has been estimated from a variety of paleotemperature proxies. These results imply that factors other than CO₂ are needed to explain these intervals of global warmth.

topic shifts that occurred there during the Holocene.

Precise and Reliable Brain Trains

The precision of action potential timing has become a central issue for the understanding of interneuron function in the cortex. Using paired recordings in brain slices, Galarreta and Hestrin (p. 2295; see the news story by Helmuth) studied the reliability of precise spike transmission between pyramidal cells and fast-spiking interneurons, a subset of cortical inhibitory cells. Neuronal firing at this connection occurred during a limited time window that lasted for about 1 millisecond and corresponded closely to

the rising phase of the excitatory postsynaptic event. This precise transmission may constitute an essential mechanism that enables the synchronous firing of fast-spiking GABAergic networks.

A Bit Too Quiet in Old Star Clusters

Globular clusters are spheroidal structures found in the halos of galaxies that formed early in the universe (about 12 to 14 billion years ago) before galactic disks formed. Grindlay *et al.* (p. 2290; see the 18 May news story by Watson) studied the stellar population in 47Tuc, a globular cluster in the Milky Way Galaxy using the Chandra X-ray Observatory. They found that about 50 to 55% of the x-ray sources are millisecond pulsars (MSPs), 30% are accreting white dwarfs, 15% are binaries in flare outburst, and a few are quiescent, low-mass x-ray binaries. MSPs may be spun up by accretion onto the neutron star in quiescent x-ray binaries, but the number of quiescent binaries in 47Tuc is too small to explain the number of MSPs, so alternative modes of formation may be needed to explain the population of MSPs in 47Tuc. These and other findings for 47Tuc suggest the need for revisions to models of early stellar evolution. 

Redox Control of Growth

Prokaryotes sense change in environmental oxygen through a two-component signal transduction system and adjust their metabolism accordingly. Surprisingly, oxygen is not the molecular signal that regulates this process, which involves a membrane-as-

sociated sensor kinase and a response regulator that modulates gene expression. Georgellis *et al.* (p. 2314) have determined that the redox state of membrane-bound quinones regulates the ArcB sensor kinase of the bacterium *Escherichia coli*; quinones are carriers in electron transport chains that are linked to metabolic reactions.

Whither CO₂?

Calculation of the amount of carbon dioxide fixed by photosynthesis is crucial to predicting the course of future climate change (see the Perspective by Wofsy). The size of the U.S. terrestrial carbon sink has been a subject of much debate. Pacala *et al.* (p. 2316) provide a comprehensive analysis comparing estimates derived from forest inventories with those from atmospheric models of carbon dioxide concentration. Although the estimates of the sink vary by a factor of nearly two (from 0.3 to 0.6 petagrams of carbon per year), the range of estimates from both methods is similar. Fang *et al.* (p. 2320) report changes in the storage of living forest biomass carbon over the past half century in China, using data from the continuous national forest inventory. Their results suggest that reforestation in China may be contributing to global terrestrial carbon sinks.

Collateral Damage

Potentially dangerous drug-drug interactions can occur when xenobiotics, such as the St. John's wort ingredient hyperforin, activate the nuclear pregnane X receptor (PXR) because this receptor is a transcription factor that stimulates expression of cytochrome P450, an enzyme that metabolizes many small molecules, such as the immunosuppressive drug cyclosporin. Watkins *et al.* (p. 2329) have determined the crystal structures of the ligand-binding domain of the human PXR alone and in complex with the cholesterol-lowering drug SR12813. Although the PXR is known to bind a variety of compounds, several polar residues within a mostly hydrophobic cavity were shown to specify a directed promiscuity and to mediate binding of SR12813 in three distinct orientations; targeted mutagenesis of these residues served to graft sensitivity to SR12813 onto the formerly inert mouse PXR. **X**

Make or Break

Large bacterial viruses (phage) break out of their host cells by making a hole in the host's cell membrane, which allows the release of a virus-produced enzyme that degrades the cell wall (see the Perspective by Hatfull). The small, single-stranded counterparts of these phages have a different strategy for attacking the cell wall and produce proteins that inhibit various steps in bacterial cell-wall synthesis. Bernhardt *et al.* (p. 2326) show that the protein A₂, from the group III ssRNA phage Qβ, blocks the first enzyme in cell wall synthesis, and, as a result, 20 minutes later the cell walls of the growing bacteria begin to disintegrate.

Executive Recruiters

Transcription activators can recruit the histone acetyltransferases (HAT) complexes SAGA and NuA4 to stimulate transcription from chromatin-assembled DNA templates, but the mechanism for targeting these complexes to promoters is unclear. Brown *et al.* (p. 2333) now demonstrate that acidic activators interact with Tra1p, a subunit that is found in both of these complexes; hence, Tra1p is likely to be an essential component involved in the recruitment of HAT to promoters for the modification of histones.

Ionic Mechanism of Hearing

The outer hair cells of the mammalian cochlea are specialized cells and function early on in the hearing process. Recently, prestin, the motor protein responsible for the electromotility of outer hair cells, has been identified and cloned. Oliver *et al.* (p. 2340) found that the unusual voltage sensitivity of this protein is not intrinsic but depends on the presence of intracellular anions, such as bicarbonate and chloride, which behave like extrinsic voltage sensors. In binding to the motor protein, they trigger the structural rearrangements in the molecule that underlie outer hair cell electromotility.

RESOLVING THE RIDDLE: NUCLEOFECTION™

Movies tend to portray research scientists as people out of this world.

And, they're not far off the mark. Everyone knows that the DNA must be in the nucleus in order to work. But for decades people have been taking a more tortuous route. We have a shortcut:

Nucleofection™. The DNA is quickly transferred into the nucleus. Also of primary cells. To do this you don't have to spend a lot of money (which should interest the controllers), and Nucleofection™ is really quite simple (which should interest the scientists whose time is costly). And neither are viruses necessary (which should interest all those with a concern for safety). And if you're not employing primary cells for research you can still work ten times faster with cell lines using the Nucleofector™.

After all, it's up to you into which nuclei the DNA is being transferred. The important thing: it gets there directly. For more information click: www.amaxa.com or call +49 (0)221-99 199-400 to get in touch - directly.

See us at, FEBS booth No. 40

gene transfer begins here.

IT WORKED OK,

BUT THEN AGAIN,

OLD

VS.

NOW

SEE THE FUTURE

transAM™

The future in studying transcription activation.

Trans-AM combines high sensitivity with high throughput in assaying activation of transcription factors from mammalian tissue or cell extracts.

Trans-AM NFκB uses an oligonucleotide containing an NFκB consensus site immobilized to a 96-well plate at high densities*. The active form of NFκB contained in cell extracts specifically binds to this oligonucleotide. Trans-AM uses an ELISA format with colorimetric readout.

Trans-AM allows accurate quantitation in matter of hours instead of days. Radioactive probes, endless gel exposure, troublesome cloning or inefficient cell transfection is no longer required to measure transcription factor activation. Inconsistencies due to variable reporter plasmid transfections are eliminated as is the need to construct stable cell lines carrying reporter genes.

Trans-AM NFκB p50 and p65 assay kits are now available.

Trans-AM API and Trans-AM CREB coming soon!

*Technology covered by AAT filed patents and licensed exclusively to Active Motif.

Applications in signaling pathway investigation:

- Drug screening and/or potency
- Inhibitor or activator protein study
- Cytokine stimulatory effect
- Protein structure/function study

Advantages:

- Procedure 10-fold more sensitive than gel shift
- Yields result in less than 3.5 hrs
- Allows quantitative study from cell or tissue extract
- Compatible with high-throughput systems
- Non radioactive assay, no cell transfection hassles

Active Motif carries a line of antibodies to the NFκB pathway for further analysis.

Can my instrument
keep growing as my
needs expand?

Yes.

Candace Swimmer, Ph.D.
Associate Director, Genomics, Exelixis

AB Applied Biosystems
Data. Decision. Discovery.

Staying at the forefront of today's technology curve isn't easy, so as you choose a platform for production-scale DNA analysis, consider how your investment will evolve over time. Exelixis did just that when they chose the ABI PRISM® 3700 DNA Analyzer from Applied Biosystems.

They knew they would benefit from ongoing enhancements, new application protocols, and additional sample management solutions. It's a practice Applied Biosystems follows with all our systems so your equipment evolves as quickly as your research needs. Because at Applied Biosystems, we believe instrument systems should only get better with age. For more information on Exelixis and other satisfied users, go to www.3700.com.

Applied Biosystems is committed to providing the world's leading technology and information for life scientists. Applied Biosystems consists of the Applied Biosystems and Cetus Genomics businesses.

The ABI PRISM 3700 DNA Analyzer includes patented technology licensed from Hitachi, Ltd., as part of a strategic partnership between Applied Biosystems and Hitachi, Ltd., as well as patented technology of Applied Biosystems. The ABI PRISM and its design and Applied Biosystems are registered trademarks of Applied Biosystems or its subsidiaries in the U.S. and certain other countries. Exelixis is a registered trademark of Exelixis, Inc. For Research Use Only. Not for use in diagnostic procedures. © 2001 Applied Biosystems. All rights reserved.

CELLS-TO-cDNA IS IDEAL FOR REAL-TIME AND GEL-BASED RT-PCR

Cells-to-cDNA

Lets You Skip RNA Isolation Altogether

Cell lysis, RNA stabilization,
DNA removal,
and cDNA synthesis
all in one tube

From cultured cells to
PCR-ready cDNA in less
than two hours

For PCR-based
applications, including
Real-time PCR

Amplification Plot, Real-time GAPDH PCR

iBlink
PRODUCT INFO

GET CELLS-TO-cDNA INFORMATION IN THE BLINK OF AN EYE.

SIMPLY E-MAIL US AT iblinkcells@ambion.com (NO SUBJECT OR BODY MESSAGE REQUIRED)

AND WE WILL AUTOMATICALLY SEND YOU THE PROTOCOL AND ADDITIONAL TECHNICAL INFORMATION.

With Cells-to-cDNA, you can generate cDNA fast — without RNA isolation

Make PCR-ready cDNA directly from mammalian cells in less than 2 hours with Cells-to-cDNA. The secret is Ambion's novel lysis buffer that rapidly inactivates ribonuclease but does not inhibit reverse transcription. Cells-to-cDNA is ideal for both gel-based and real-time quantitative RT-PCR analysis and includes reagents for cell lysis, DNase treatment and reverse transcription. Cells-to-cDNA is available in both 40 and 100 reaction sizes for low and high throughput applications.

Introducing GCI Access™...

Bridging the gap between phenotype and genotype.

As genomic research focuses increasingly on the origins, treatment and prevention of diseases, researchers face a critical bottleneck: adequate number of properly consented samples linked with well-characterized clinical phenotypes. GCI Access™ breaks that bottleneck.

GCI Access™ provides access to DNA or snap-frozen tissue samples, in multiple disease states, from GCI's Global Repository™ — an unprecedented, large-scale resource for genomic research.

GCI DNA Access™ offers our partners access to high quality DNA samples collected from large patient populations, linked to well-characterized clinical data. GCI performs genotyping services utilizing Sequenom's MassARRAY™ genotyping platform. GCI Access™ offers access to up to 500 disease cases, and corresponding controls.

GCI Tissue Access™ offers access to diseased tissue and matched pairs for expression and proteomic analysis.

GCI Access™ provides researchers access to patient samples and clinical data for discovery and validation, supplying the disease cases and matched controls necessary to detect statistically powerful associations between genetic and phenotypic data. Clinical data includes extensive diagnostic data, ethnicity, family history (three generations), and ADRs, offering an invaluable tool for replication of studies and validation of targets in large patient populations.

the future of imaging is in the FX Pro Plus

The New Molecular Imager FX Pro Plus System, with an Improved Optical Path for Greater Flexibility and Expandability.

- Storage phosphor
- Fluorescence
- Multicolor
- Improved resolution
- Improved sensitivity

The Molecular Imager FX Pro Plus system represents the latest evolution of the FX family. For gel, blot, and array imaging, this single instrument combines the power of storage phosphor and multicolor fluorescent imaging. The FX Pro Plus has the flexibility to get the most out of today's diverse applications, and is expandable to keep pace with the rapidly evolving field of fluorescence imaging.

PEPTIDE ANTISERA

Partner with a Leader in CUSTOM PEPTIDE ANTISERA Services

No one is better equipped than Sigma-Genosys to be your partner in custom peptide antisera production. We produce antisera for some of the world's leading pharmaceutical companies and academic institutions. Just send us your peptide sequence and leave the rest to us.*

- Custom Peptide Design & Synthesis
- Conjugation to Carrier Protein
- Immunization into Two Animals
- Sera Collection

Save yourself the time and hassles involved in antisera production. Call Sigma-Genosys at 877-710-1502.

*Sigma-Genosys also offers a partial antisera service, in which you supply the antigen and we perform the immunization and sera collection. Optional services such as protocol extensions, ELISA and affinity purification are also available. Contact our in-house representatives for details.

*Have questions?
Call us. Whether you're a
novice or pro, you can
count on our technical
support for answers.*

Qbiogene has a Complete Array of Adenovirus Solutions

MORE FROM YOUR ADENOVIRAL PRODUCTS & SERVICES SPECIALIST

Special introductory offer for
an exceptional reference book.

For more details, call us or visit our
Web site at www.qbiogene.com

AdenoVator™

Adenoviral Vector System

Construct adenoviruses in our newest
E. coli-based vector system

Obtain the highest level of protein
expression compared to other
adenoviral vectors

Gene of interest co-expressed with
GFP or BFP

AdenoExpress™

Ready-made Adenoviruses

Save time and money using our
pre-made adenoviruses

Highest purity

AdenoExpress™ viruses are available
expressing the following genes:

- Reporter Genes: GFP, LacZ
- Biological Response Genes:
p53, IL-2, IL-12, IFN- α , IFY- γ ,
GM-CSF, Endostatin, Angiostatin
- HSV1-TK
- Wild type and null virus

MERLIN® Custom Services

The ultimate in convenience

Full range of Adenovirus services
including construction, large-scale
amplification, purification and titration

cGMP services

What would you call mutual funds that combine enhanced indexing with active management?

In investing, timing is everything. Sometimes, following an index works better. And other times, the selectivity of active management will outperform. The good news is you can get the benefits of both with the Dual Investment Management Strategy,[™] from TIAA-CREF Mutual Funds.

It's a strategy not tied to one discipline, but adaptable

to the markets' ever-changing conditions. This flexibility is so impressive that no less than Sheldon Jacobs, the no-load mutual fund authority, calls it "pure genius."

What's more, whether you choose our Growth Equity, Growth & Income, or International Equity Fund, you'll enjoy low fees and no loads so more of your money is working for you.*

To learn more, call us at
1 800 842-1924 or visit
www.tiaa-cref.org/mfs—
and put a bit of genius in
your portfolio.

He calls them "pure genius."

Sheldon Jacobs, Editor—*The No-Load Fund Investor*

Ensuring the future for
those who shape it.[™]

Award-winning

research completed at

(PUT YOUR SCHOOL ON NEXT YEAR'S LIST.)

Did you complete your Ph.D. in molecular biology* in 2000? If so, then here's a chance to gain international acclaim for yourself and the research being conducted at your school. Just describe your work in a 1,000-word essay. Then submit the essay for entry into the 2001 Amersham Pharmacia Biotech & *Science* Prize.

The essay will be reviewed by a panel of distinguished scientists, who will then select one grand prize winner and up to seven other winners.

The grand prize winner will:

- get his or her essay published in *Science*
- receive US\$25,000
- win a trip to attend the award ceremony

AMERSHAM PHARMACIA
BIOTECH & SCIENCE
Prize
FOR YOUNG
SCIENTISTS

All other winners will receive US\$5,000 and a trip to the award ceremony. Your essay may be submitted in English, French, German, Spanish, Japanese or Chinese (Mandarin). The closing date for entries is July 16, 2001. The Prize has existed since 1995 and is offered as a means to motivate students in the hope that they will continue their scientific research efforts.

Put your work (and face) in *Science*. Go to www.apbscienceprize.org where you can read the full details as well as submit your entry form. Or use the contact details (left) to find out more.

STKE PUTS YOU ON THE RIGHT PATH

With standard features like Connections Maps, Protocols, Reviews, and Perspectives, plus an extended list of helpful e-tools like *personalization options* and *interactive letters*, *Science's STKE* puts you on the right path for all the latest signal transduction knowledge.

Whether you are in an academic or industrial environment, *STKE* will suit all your needs. Even if you're not specifically involved in the field of signal transduction, we offer special features and options spanning multiple biological disciplines.

STKE is updated weekly and provides the perfect combination of quick summaries and full text access to research papers from 23 publishers and over 40 respected scientific journals. To subscribe to *STKE*, or for more information, visit *STKE* at www.stke.org and click

subscription information, or contact AAAS at (202) 326-6417 or membership2@aaas.org.

No one can know where new insights in signal transduction might lead you, but *STKE* will help you find the right path.
