College Botany *Hylander & Stanley*

This text for a year's course in general botany has four specific aims: (1) to secure a proper balance in the amount of subject matter devoted to each of the special fields of botany, (2) to suit the content and method of presentation to

the needs of the student, (3) to develop an awareness of the importance of plant life, and (4) to utilize visual instructional materials in such a way that the illustrations become actual teaching aids. 1949—\$5.00

Biology of the Vertebrates, 3rd Ed. *Walter & Sayles*

In revision, Professor Sayles has retained the mellow, humane style of earlier editions but has added much up-to-date information. The third edition has been enriched by many new

illustrations. Chapters on vertebrate types, embryology, skeleton, nervous system, and sense organs are rewritten in the light of recent advances in the field. 1949—\$6.00

Fundamentals of Comparative Embryology of Vertebrates, Rev. *Huettner*

The revised edition of this popular book follows the same general plan of organization and maintains the same morphological point of view. Chapter I takes the place of the Introduction presenting a historical account of prog-

ress in embryology. The next four chapters deal with the general aspects of embryology, cytology, and genetics in relation to genetics and endocrinology. 1949—\$5.00
