MADE IN WEST GERMANY

REVOLVER MICRO PROJECTOR

The advantages of micro-projection . . . permitting the showing of microscope slides to a group of scientists or students as well as pointing out specific details in the projected object . . . have not been fully utilized because of the complicated handling of micro-projectors that were thus far available.

With the new Carl Zeiss Revolver Micro Projector apparatus, these difficulties are completely eliminated. Six objectives coupled mechanically to suitable condensers together with special projection eyepieces instantly project an image on the screen from low (macro) up to high magnifications. All objectives are parfocal and the matched condensers provide illumination by the Koehler principle. Thereby best resolution and greatest brightness of images are assured.

Special projection eyepieces guarantee favorable fields of view, even at long projection distances. A fully automatic carbon arc lamp eliminates frequent manual adjustment, so that even untrained operators can easily handle this projector.

The Revolver Micro Projector can be quickly converted into a lantern slide projector for 2 x 2-in. slides by merely swinging a reflecting mirror, a condenser and a projection lens into the path of rays.

GAMMA RAY SPECTROMETRY

Gamma emitting samples inserted into a scintillation well counter are counted by Radiation Analyzer and standard scaler. Adjustable "window" of Analyzer is set to count only pulses that fall within a pre-selected portion of the energy spectrum, thus virtually eliminating "background".

with nuclear-chicago's NEW RADIATION ANALYZER

and your present scaler
and scintillation counter

The advantages of pulse-height selection for background and scatter-error reduction, multiple tagging measurement and energy analysis are now available for every radioisotope laboratory. The Radiation Analyzer, connected directly to your present scaler and scintillation counter, incorporates in a compact single-chassis design a non-overloading linear amplifier, pulse height discriminator and extremely stable high voltage regulator. Circuitry has been designed for simplicity, stability and high reliability.

SPECIFICATIONS

- Linear feedback amplifier with gain of 2500.
- Non-overload amplifier with delay-line shaper. Separation factor of 200.
- Overall resolution time for equal pulse pairs within 1.5 microseconds.
- Front panel switch provides integral or differential count.
- Provision for external base level control allows automatic scanning.
- Regulator for scaler high voltage supply variable from and ultra-stable power supplies provide long term stability.
- Single turn control. Computer tubes, precision components.
- Base level adjustable 0-100 volts with ten-turn potentiometer. Channel width of 0-10 volts provided by precision.
- Rate amplifier output.
