from sphericity. In another paper A. F. Kip (University of California) discussed a new phenomenon observed in experiments on the Azbel'-Kaner cyclotron resonance in aluminum. Qualitative changes in the resonance were observed when the applied magnetic field was inclined with respect to the sample surface at angles as small as a few minutes. Kip explained how such changes might be caused by the existence of current sheets in the interior of the sample. Although the argument in this case depended on a special feature of the Fermi surface geometry of aluminum, it appears that similar effects observed in other metals may have similar origins and that these effects, once understood, may increase the utility of these experiments as sources of information on the Fermi surfaces of metals.

M. H. Cohen (University of Chicago) reviewed recent progress in the theoretical understanding of metals, and briefly discussed the use of pseudopotentials in the calculation of metallic parameters and the attempts to study many body effects in real metals by interpolating into the existing theory the Landau theory of Fermi liquids. He also discussed a general framework for theoretical calculations in metals. This framework is based on a decomposition of the desired property into parts of decreasing magnitude. The first depends only on electron density, the second on electron density and composition, and the third on electron density, composition, and structure. It can be shown that such decomposition is possible and is in accord with such simple general features of metals as the similarity of properties of different alloys that have similar average compositions and the insensitivity of properties, such as electrical resistivity, to changes in structure that occur in melting.

Experimental and theoretical aspects of transition metals were discussed in several very interesting papers on chromium. J. A. Marcus (Northwestern University) described measurements of the anisotropy of the magnetic susceptibility. His results indicate that chromium is not magnetically cubic if cooled through the antiferromagnetic Nèel temperature (312°K) in a magnetic field. Striking changes in the anisotropy also occurred at a spin flip temperature of 120°K, a transition temperature that had previously been detected only by neutron diffraction and in measurements of elastic constants. Further indications that chromium is

not magnetically cubic in the ordered state were among the results of experiments on critical scattering of neutrons near the Nèel temperature (A. R. Mackintosh, A.E.K. Research Establishment, Denmark). B. R. Watts (Cambridge University) described measurements of the de Haas-van Alphen effect in chromium in pulsed magnetic fields above 100 kilooersteds on samples which had been cooled through the Nèel temperature in fields of about 80 kilooersteds. The pulsed measuring field did not eliminate the effects of the cooling field and the de Haas-van Alphen periods showed tetragonal rather than cubic symmetry, indicating significant changes in the Fermi surface geometry due to the magnetic ordering.

W. Marshall (United Kingdom Atomic Energy Research Establishment, Harwell) suggested that the Mössbauer effect has reached the end of its "gee-whiz" phase and is now taking a place as a routine tool of the solid-state physicist. After reviewing some past successful applications, he discussed some current and future applications which included the measurement of the temperature dependence of the magnetization in ferromagnets near the Curie temperature and the study of localized magnetic moments in alloys.

Dealing with some current problems with defects in solids, E. W. J. Mitchell (University of Reading) quickly reviewed the historical background of intrinsic defects in the alkali halides and then elaborated on the problem of the mechanism of the production of such defects by electron irradiation and the use of this means to produce them in controlled numbers. The structure of optical absorption spectra in zinc sulfide, cadmium sulfide, and diamond was also covered. C. D. Clark (University of Reading) effectively supplemented this discussion in his paper on the absorption bands of color centers in natural diamonds after electron irradiation and heating. It was shown that these bands, which are analogous to those of Mössbauer  $\gamma$ -ray spectra in solids, are closely associated with the four phonon frequencies that correspond to the maximum density of lattice modes for the various vibrational branches.

Interest was focused on another current problem of defect physics—the mechanism of self diffusion in bodycentered cubic metals. J. N. Mundy (United Kingdom Atomic Energy Research Establishment, Harwell) pre-

sented data on the relative diffusion rates of the radioisotopes  $Na^{22}$  and  $Na^{24}$  in sodium. In principle the mechanism of diffusion could be determined by such measurements, but unfortunately the nature of the results makes it impossible to distinguish between a relaxed vacancy and a two-atom interstitial as the dominant mechanism of diffusion in sodium.

One of the most interesting papers on research in semiconductors was presented by K. F. Hulme (Royal Aircraft Establishment, Malvern) who discussed the changes in tunnel current in germanium tunnel diodes at  $300^{\circ}$ C. From observations of changes in current due to arsenic impurities that move a few angstroms by diffusion and drift at the *p*-*n* junction, the diffusion characteristics of arsenic in germanium were calculated. The results were consistent with data obtained by other techniques and extrapolated for high temperatures.

In another area of semiconductor study, D. L. Greenaway (R.C.A., Zurich) showed the effectiveness of optical reflectivity studies in the evaluation of the band structure of semiconductors and semimetals. Measurements on materials with rocksalt structure (PbS, PbSe, and PbTe) and the semimetals (As, Sb, and Bi) reveal a consistent picture of deep-lying band structure when they are correlated with other experimental and theoretical results.

One of the few papers with an immediate practical application was given by M. J. Aitkin (Oxford University) who described the usefulness of thermoluminescent studies for dating ancient ceramics. Measurements on many pottery fragments, varying in date from 5500 B.C. to A.D. 1500, show that the glow emitted when a pulverized sample is heated in the temperature range of  $350^{\circ}$  to  $500^{\circ}$ C is proportional to the age of the sample if the glow curve is taken in an atmosphere of nitrogen and the sample is not exposed to light after grinding.

## EMDECO System.. for vibrationless time lapse photomicrography

The EMDECO system of time lapse photomicrography integrates a series of precision components to provide motion pictures of practically any object which can be viewed through a microscope. Absolutely motionless photomicrography at the highest magnifications is made possible by EMDECO's patented method which halts all moving parts in the unit throughout the duration of the exposure. This unique system is always in synchronization with the shutter, no matter which exposure cycle has been selected.

The EMDECO system premits making time lapse photomicrographs of the highest quality at any exposure time from  $\frac{1}{4}$ to 15 seconds at any exposure interval from 1 to 60 seconds. It may also be set to operate at the standard camera speeds of 1, 2, 4, 8, or 16 frames per minute.

The system is designed to operate with any one of four 16 mm motion picture cameras: The Kodak Cine Special 1 or II, the Kodak Reflex Special and the Bolex H-16. A drive unit for the 8 mm Bolex Special is also available from EMDECO.

All standard microscopes are suitable for use with the EMDECO cinephotomicrographic system.

Photomicrographs provided by this unit are precise and with minimal parallax. The EMDECO system is specially suited to medical research, bacteriology, physiology, geology, crystallography and industrial research. The method has been used successfully for the photomicrography of such biological specimens as tissue cultures, blood samples and bacteria. It is ideal for the study of any substances such as metals, minerals and crystalline formations—which would be changed by time or temperature.

No photographic experience is necessary to obtain truly professional time lapse photomicrographs with the EMDECO system.

12 JUNE 1964

0.2 µg./ml. P6. 250 µg./ml. Cu present in acetate buffer pH 4-5 with electrical compensations. S 1/6. Polarogram from the Davis-Southern A-1670.

> Newest development in Polarography over 100 times more sensitive than conventional instruments...for quick, easy, economical operation in routine analytical work, as well as research analysis

## THE ALL-NEW A-1670 DAVIS-SOUTHERN CATHODE RAY POLAROTRACE

The Cathode Ray Polarotrace can be used for the determination of most substances (organic and inorganic) for which methods have already been developed by other types of polarographic instruments, with the additional

#### **NEW FEATURES**

- BASE LINE SLOPE CORRECTION
- CAPACITY CURRENT COMPENSATION
- STANDING CURRENT COMPENSATION
- FORWARD/REVERSE SWEEP: valuable in the study of oxidation reactions and reversibility
- HIGH TOLERANCE TO PRECEDING REDUCTIONS
- AUTOMATIC SYNCHRONISM
- R C DERIVATIVE: differentiating constants of 10 ms, 30 ms, and 100 ms
- Noise level equivalent to an input current of less than 10<sup>-10</sup> amp.
- A new Electrode Stand which incorporates a mechanism for knocking the drop off the capillary

advantages of superior sensitivity, better resolution, ease and rapidity of operation, reliability, direct display and built-in derivative operation. Chemical preparation is, in most cases, considerably simplified, speeding up actual analysis. ¶ The wide range of applications includes Metallurgical Analyses, Effluent and Water Analyses, Food and Drink Quality Control, Agricultural Research, Medical and Cancer Research.

#### PROVIDES A COMPLETE POLAROGRAM

#### A COMPLETE POLAROGRAM Every 7 Seconds!

The entire change of potential is effected during the lifetime of a single mercury drop...cutting analysis time to a fraction!

LABORATORY APPARATUS . REAGENTS AND CHEMICALS

## PLATINUM BY BISHOP BECAUSE NOTHING ELSE DOES IT AT SO LITTLE COST

Platinum, the miracle metal of so many uses, is surprisingly economical to use.

Platinum metals resist high temperatures, provide exceptional resistance to corrosion and erosion, perform catalytic actions. Yet, after years of service, the original metal can be recovered at a dollar value almost equal to original cost. This makes Platinum the soundest possible investment.

Bishop's broad line of lab ware, tubing, wire, gauze, sheet, strip, salts, and chemicals and Bishop's facilities and capabilities are described in detail in our catalog. Request a copy.

## You Mean I'M Eligible for TIAA Insurance?

The news about the very low net cost of TIAA life insurance is sometimes slow in getting to new college staff members-TIAA doesn't have soliciting agents.

But when they do hear, people who are eligible have a way of making up for lost time. The average size TIAA policy bought during 1962 was for \$21,000. And more than half of the life insurance issued that year was to "satisfied customers coming back for more."

Eligibility for TIAA life insurance is open to all employees of colleges, universities, private schools, and certain other nonprofit educational or scientific institutions. If you're eligible, use the coupon below to request a copy of TIAA's new Life Insurance Guide and a personal illustration of low-cost TIAA insurance at your age.

Teachers Insurance and Annuity Associat 730 Third Avenue, New York 17, New Y

# a complete dc laboratory

The Keithley 610A Electrometer has 64 dc ranges . . . all you need to investigate in-circuit measurements with no loading, semi-conductor parameters, capacitor characteristics, photo-electric devices, piezo-electrics, properties of insulators and outputs of ion chambers. The 610A is line-operated and comes in bench or rack models. Brief specifications:

- 9 voltage ranges from 0.01 to 100 volts fs with 2% accuracy on all ranges
- input impedance selectable in decade steps from 1 ohm to 1014 ohms
- 28 current ranges from 3 amperes to 10-13 ampere fs
- 27 resistance ranges from 10 to 10<sup>14</sup> ohms fs with provision for guarding
- constant current source from 1 milliampere to 10-12 ampere in decade steps
- gains to 1000 as a preamplifier, dc to 500 cps bandwidth, 10 volt and 1 milliampere outputs
- price \$565

#### Other ELECTROMETERS

Model 620,	31 ranges, batoperated,	\$280
Model 621,	37 ranges, line-operated,	\$390
Model 600A,	54 ranges, batoperated,	\$395
Model 603,	50 kc bandwidth amplifier,	\$750

## ESCAPING RADIOACTIVITY

Problem: A convoy has been attacked by a thermonuclear weapon. What maneuvers will permit the ships to best avoid the radioactivity that will follow?

This is an example of the challenging tasks assigned to the Center for Naval Analyses of The Franklin Institute.

Several possible tactics have been evaluated by CNA analysts. Each has its advantages and disadvantages. If the convoy stays together and maintains course, possibility of collision is minimized, but the swiftest escape from contamination may not be attained. While other maneuvers may reduce the possibility of contamination, they may lead to confusion, minimizing the convoy's over-all progress, and increasing the danger of repeat attack. The conclusion is that one of the intermediate tactics is best.

**CAREER OPPORTUNITIES** in this and other problem areas are now available with CNA for Operations Analysts, Mathematicians, Physicists, and Engineers. For additional information, write:

Director CENTER FOR NAVAL ANALYSES Dept. S

# **DUAL-BEAM OSCILLOSCOPE** for research applications

### APPLICATION OF THE TYPE 565 OSCILLOSCOPE IN NEUROPHYSIOLOGICAL RESEARCH

Researchers in the neurophysiological laboratory at Oregon Regional Primate Center use a Tektronix Type 565 Oscilloscope in the study of electrophysiologic responses in animals. Neuroelectric responses are evoked by stimulation through implanted electrodes on the animal's cerebral cortex. A major objective is evaluation of measurable parameters of stimulation.

Parameters of interest include data on stimulation current, voltage, and time. These as well as the EEG before and after stimulus, and other sensory information are monitored and recorded by the instrumentation console—which includes the C-12 Camera and Type 565 Oscilloscope. Using the Type 565 dual-beam and delaying sweep features—and differential inputs of the plug-in units—the investigators can analyze electrophysiologic response to electrical stimulation of the sensory cortex.

Composite waveform display shows the same signal at different sweep speeds. Faster sweep rate is 0.01 sec/cm. Slower sweep rate is 0.5 sec/cm. The configurations show:

■ Reference recording from animal cortex ■ Long-term effects of overall stimulation ■ Instantaneous changes of the cortical impedance ■ Pre and post cortical polarization potential

CALL YOUR TEKTRONIX Field Engineer for A Demonstration. Type 565 Oscilloscope . . . \$1400 (without plug-ins)
