

time to the task of managing the flood of scientific information. This attitude is untenable. Every scientist must accept his share of the responsibility for controlling scientific information. He must realize, as a matter of course, that when he adds to the cascade of scientific information, he assumes a responsibility to participate in the management of the flood.

"I believe the university has a clear duty in this connection. Our coming generations of scientists must be taught to accept their responsibility toward information—not grudgingly and with half heart, but fully and constructively. This attitude represents a change from the prevailing attitude. Scientists generally fail to see why they should be bothered with helping to manage scientific information; this they learn from their professors and colleagues who are similarly disinclined to make the necessary sacrifices.

"But sacrifices will have to be made if science itself is not to collapse. The education of every scientist will have to include instruction in handling the new and ingenious tools of information retrieval. The educational process will even more have to inculcate into all scientists a willingness to contribute time and effort in behalf of the entire scientific communication system."

Aphids

Five projects for studying factors affecting the biological control of the arthropod pests of food crops have been proposed as part of the International Biological Programme. One of these projects concerns aphids. After consultation involving more than 100 aphidologists in all parts of the world, the project has been orientated around the green peach aphid, *Myzus (Nectarosiphon) persicae* Sulz., and other aphids associated with it on various crops. While the proposal is focused on this one species of worldwide importance, findings will also be relevant to the evaluation, selection, and implementation of biological methods to be used in biological and integrated control programs for crop aphids in general. Since the information required will be largely ecological, the project is being assisted by the publication of reviews of what is known of the biology

We decided to eliminate some limitations of Metallurgical Microscopes.

Now there's the Wild M50

Unprecedented versatility for investigating surface structures in incident light.

The stability to assure vibration-free observation even in photomicrography.

Combine these M50 features with 1. The world's finest optics and mechanical precision. 2. A complete range of accessories for photomicrography, projection, and discussion. 3. Fingertip switching from darkfield to brightfield. 4. Polarizing feature. 5. Inverted construction for all size specimens.

You'll conclude that in Metallurgical Microscopes, there's the Wild M50.

Write or call for Booklet M50.

Mightymite

Sometimes you can pack exceptional performance in a small frame. □ Take our Model HN. □ This bench-type centrifuge offers many features found only on higher-priced floor models. It accepts all Clinical accessories, plus fifty different heads and accessories to allow hundreds of combinations. Everything from micro-hematocrit heads to 100 ml. tubes both horizontal and angle.

It offers R.C.F.'s up to 6190 g. And you get automatic timer, stepless speed control, electric brake, and optional tachometer. □ Price: \$295. □ Small wonder we call the HN our Mightymite. For more information write for Bulletin HN, or call your IEC Dealer for immediate delivery.

"DIAL" ULTRA-THIN SECTIONS?

Precisely . . . since the new Reichert "Om U2" ultramicrotome is automated. Now you just dial for single or continuous ultra-thin sections for electron microscopy. With all controls dial or push-button operated, you merely "select" speed, sequence and thickness of sections. The completely inertia-free thermal advance of the "Om U2" represents a major breakthrough in ultramicrotomy.

The "Om U2" gives you the accuracy of the thermal advance and the advantages of a precision, mechanical advance in one instrument. The tedious task of producing useful ultra-thin sections is now a thing of the past.

and ecology of the aphids and their natural enemies.

A meeting to discuss methods and work plans for obtaining more information about biological aspects of aphid control was held in England at the Imperial College of Science and Technology (Field Station), 6-7 April 1967. The coordinator of the project, M. J. Way, brought together a small group of aphid workers from various parts of the world. They were helped by a representative group of British workers including experts in insect ecology. The meeting had no formal agenda but the discussion led to a clearer understanding of fields of work in which information was most needed. Such fields include: (i) Recognition and determination of the biological properties of aphid species and biotypes; (ii) relation of aphid and host plant; (iii) the determination of predatory species and of their role in the control of aphids; (iv) the evaluation of parasites and pathogens; (v) the role of aerial movement; (vi) the sampling techniques for aphids and associated species on plants; and (vii) population dynamics.

Within these fields useful reviews of methodology were made; the comparisons of the experience of several workers with the same method were particularly illuminating. Finally, ways in which the international nature of the project could be exploited were discussed.

Three approaches seemed open: (i) Complementary studies. Development of individual projects would result in much better coverage of the fields relevant to biological control. (ii) Comparative studies. Geographic separation of the study centers would provide opportunity to study, with standardized methods, the nature and effects of the genetic make-up of the population and the physical and biotic environment. (iii) Collaborative studies. A planned sequence of observations or experiments in different centers could provide principles with predictive value as, for example, studies in aerial movement in relation to future pest outbreaks.

It was decided that a set of methodology reviews by specialists in the different fields should be prepared and published in the I.B.P. Handbook series. It was agreed that although complementary studies could be initiated soon, some collaborative studies might need to wait until appropriate methodology had been selected and tested.

It was also agreed to circulate de-

WACO POWER STIRRER

HIGH TORQUE

FOR CONTINUOUS
24 HOUR SERVICE

ONLY... \$29⁵⁰

No other stirrer made will give as much service per dollar. Use the WACO Power Stirrer 24 hours a day, 7 days a week for months at a time... not a stock motor converted to a stirrer, but a sparkless induction type motor specifically designed for laboratories... where long, continuous use is required. Two shaft speeds, 300 and 600 R.P.M., cover the majority of applications. A built-in cooling fan allows continuous operation without overheating or burning out.

86100—WACO Power Stirrer, with tubular brass mounting rod and 6 foot cord... only \$29.50. Stirrer chucks, \$1.85 ea., set of three stirring rods (small, medium, large), \$8.00.

Order direct or write for descriptive folder.

MUNKTELL FILTER PAPERS

NEW FILTRATION CHART NOW AVAILABLE

Munktell filter papers were started by Berzelius back in 1815 and they have been the choice of analytical chemists all over the world ever since. Meticulous attention to every detail in their manufacture coupled with the most demanding quality control standards have made Munktell the recognized leader in reproducibility.

A new filter properties chart that gives details of retention and filter speed for each Munktell grade is now available. For your free copy contact your laboratory supply dealer or fill in the coupon and return it to Bio-Rad — the Munktell representative for the United States.

BIO-RAD Laboratories 32 & Griffin Ave., Richmond 3, Calif. S-298

Gentlemen:
Please send me the new handy Munktell filter properties chart and the name of my nearest Munktell dealer.
Please include the complete Munktell catalog and price list FP-1.
