

new "dwarf" varieties of basic food-plants are being developed that respond to fertilizers in a dramatic way, and the tropics are coming to be recognized as potential major food-producing areas. None of these programs would do any good unless accompanied by a reduction in human fecundity—which has no way to go but down—but population control is next to impossible in countries existing below subsistence levels.

The final talk of the meeting was given by Stanford psychiatrist David A. Hamburg, who spoke on "Mental health and progress in the behavioral sciences." His paper was more technical than the others. He described recent research on behavior under stressful conditions, research with nonhuman primates on the evolution of behavior (especially social), and research on the relations between social learning and hormone production. He exhorted the present generation of students to devote itself in larger numbers than his generation had done to the solution of such vital problems as the sources of aggressive behavior.

In his closing remarks, provost Thimann summarized the proceedings on behalf of the host institution by saying that perhaps a new profession might be in the making, that of the government adviser on science and technology. Educational requirements would not be so very different from those of a good science writer.

The symposium was supported by a grant from the Sloan Foundation.

Measuring low light levels

...requires extremely low dark currents coupled with maximum useful sensitivity. The EMI 6256, a 13-stage venetian blind 2" photomultiplier tube has the essential characteristics that are necessary for low light level applications. The unique 10mm cathode-DI geometry, together with the ultra-stable EMI venetian blind design, has resulted in its widely successful use in astronomy, biology and spectrophotometry. The EMI 6256B has a quartz window and the S-11 cathode (S-13) which has a peak quantum efficiency of 17% at 4,200 Å. The EMI type 6256S has 5 to 10 times lower dark current than the 6256B, and should be used when system performance is dark current limited. This type is also available for visible light applications as 9502B/9502S, or with 11 dynodes as 6094B/6094S. Many other EMI photomultiplier tubes are available for special applications from stock in sizes from 1" to 12". EMI photomultiplier tubes are available through qualified engineering representatives located in major marketing areas throughout the United States. Why doesn't somebody design an inverted microscope specifically for tissue culture and other biological studies?

Somebody has. It's the Wild M-40.

This is no modification. It's the newest, highest state-of-the-art in inverted microscope design and construction. In mechanical precision. In optical quality. And in conveniences, operating speed and ease. It's the first of its kind, a typical Wild classic. Write for Booklet M-40.

20-second quality control

Holding to rigid quality control standards is fast and easy with a Bausch & Lomb Abbe 3-L Refractometer. You just *load, light and look* . . . get your answer in 20 seconds. Horizontal, up-front prisms load in *10 seconds*—wipe off easily. Light-up takes *2 seconds* . . . with built-in, push-button scale illuminator. *8 seconds* to read . . . any product within the range of ND 1.30-ND 1.71, or percent total solids from 0-85%. Accuracy is to 1 unit in the fourth decimal place. Operation is fast, easy and so comfortable there's no fatigue . . . even after all day production use. This most widely used refractometer is priced right at just \$850*.

For the utmost accuracy over a wide index range, your ultimate choice should be the B&L Precision Refractometer. Three models with different ranges cover a total range of ND 1.20-ND 1.70. Under proper working conditions, it's possible to get index readings to 3 units in the fifth decimal place. And the price is just \$1840*.
