SIMPLY POWERFUL

BIO-RAD'S NEW CONSTANT POWER SUPPLY. ALL OF THE ESSENTIALS AT A SENSIBLE PRICE.

The era of the easy-to-operate, low priced constant power supply for electrophoresis is now here. Bio-Rad's new Model 1420A gives you all the constant power you need for electrofocusing, DNA sequencing and similar electrophoresis techniques.

Operation is simplicity itself. The 1420A has just two front panel controls—a mode switch and an output level switch. Set them once at the start of the run. No need to select or switch ranges during the middle of the run.

By sticking to the essentials, Bio-Rad is able to offer you this fine power supply at a remarkably economical price.

The powerful facts about the 1420A are: output power, 0.5 watts to 200 watts; output voltage, 20-2000 volts; output current, 150 ma; output regulation $\pm 1\%$.

When you combine the 1420A Power Supply with the versatile Model 1415 or

1405 Cells, you have the makings for truly great electrophoresis systems. An example is shown below.

Call, write or circle the reader service number below for the latest on Bio-Rad electrophoresis.

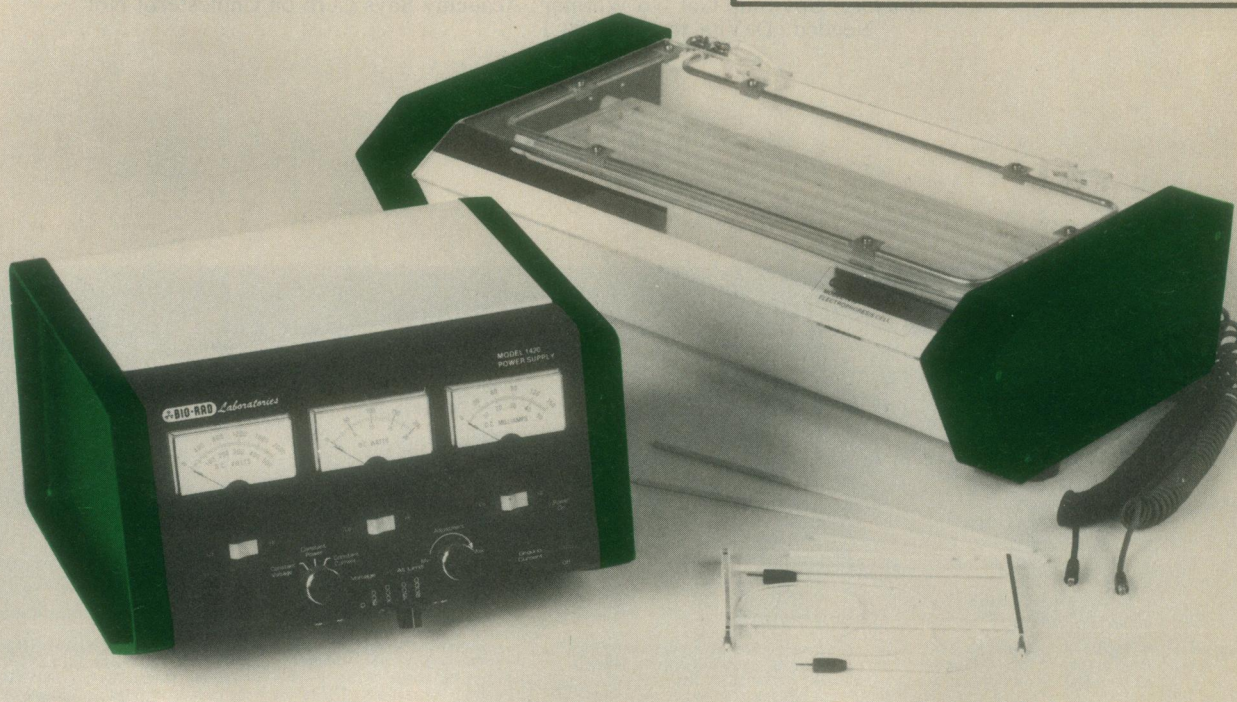

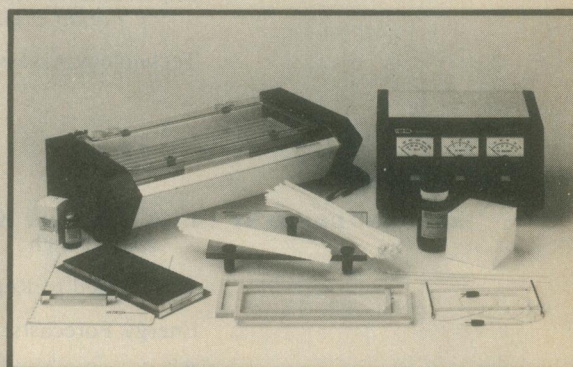

BIO-RAD *Laboratories*

2200 Wright Avenue • Richmond, CA 94804

Phone (415) 234-4130

Also in Rockville Centre, N.Y., Austria, England, Germany, Italy, Japan, The Netherlands, and Switzerland.

Bio-Rad's Preparative Electrofocusing System includes the Model 1420A Power supply, Model 1415 cell, Electrofocusing electrodes, glass trays and all the chemicals and accessories needed for preparative electrofocusing.

COVER

Complex radar backscatter patterns in a nearly calm region of the ocean located just outside the mouth of the Chesapeake Bay (taken on 28 September 1978 by Seasat Synthetic Aperture Radar). Horizontal dimension is equal to 100 kilometers; inherent resolution in both dimensions is 25 meters. See page 1373. [C. Wu, Jet Propulsion Laboratory, Pasadena, California]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

We've just added higher resolution and contrast to Olympus Vanox. Introducing: new Olympus LB objectives.

Our new LB objectives are measurably clearer and provide higher resolution and contrast than our Vanox universal research microscope ever offered. Considering the objectives they superceded, that's quite an achievement.

By creating a matched system of eyepieces and objectives, we were able to distribute lateral chromatic aberration correction between both, instead of correcting it in the objective alone. This preferred system gives us more freedom to correct field curvature, astigmatism and other aberrations, especially at the periphery of the field. The result is flatter fields, increased resolution, crisper images, without eyepiece color.

Long-barrel construction offers more room for optical improvements, such as the convenience of parfocality at every objective magnification from 1.0X to 100X. Even the matching eyepieces make observation easier: by shortening the distance from eyepiece shoulder to image plane, we give you a wider visual field (our new standard eyepieces have a field number of 20), while keeping a comfortable 18.8mm eye relief, enough even for eyeglass wearers.

And because the Vanox is a truly universal microscope, the LB series will include LB Plan Apochromats, Plan Achromats, Phase Plan Achromats, Fluorites, Achromats and other objectives.

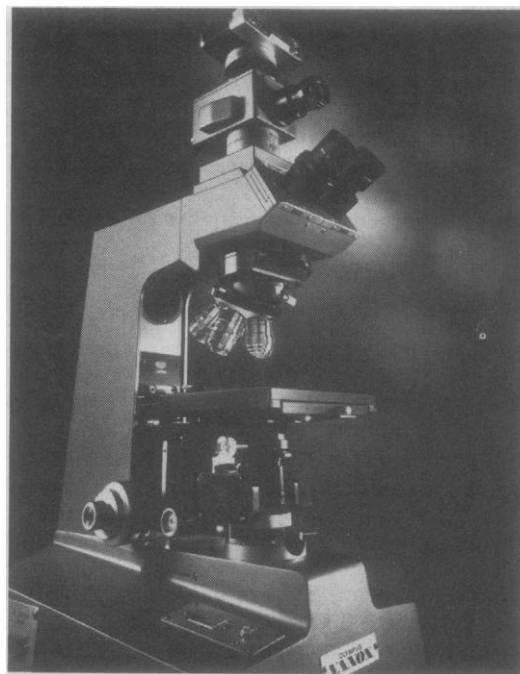

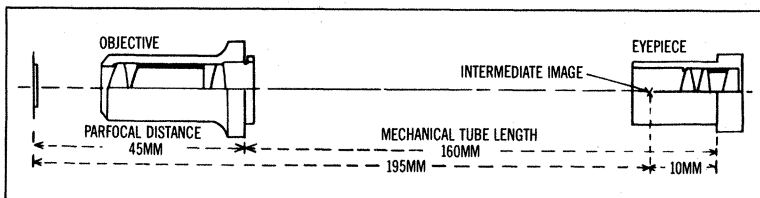

But optics are just part of the Vanox story, for the Vanox is more a system than a microscope. Based on a frame whose ultra rugged construction assures rock-steady, vibrationless observation and photomicrography, the Vanox system includes optical, mechanical, illumination and photographic modules for virtually every research need: phase contrast, differential interference contrast (after Nomarski), fluorescence, polarized light and darkfield illumination—available in most cases for transmitted as well as incident light.

Options for photomicrography include accessories for large-format film or Polaroid packs, as well as for 35 mm film, with manual or automatic exposures up to 32 minutes, advanced color temperature regulation and data imprinting.

Human engineering, however, is not an option—it is basic to Vanox design. When a microscope system is designed to grow with your changing research needs over the next decades, its operation must be as comfortable and natural as it is precise.

The Vanox is the culmination of 60 years of Olympus microscope design and manufacturing experience.

Write for a free brochure describing the Vanox and its LB objectives. Or for a demonstration, see your Yellow Pages for the National Olympus Sales & Service Network.

Books and Reports from the National Research Council Span the Sciences

Whether you are a criminologist, a nuclear physicist, a demographer, a biochemist, or a physician you will find during any year one or more NRC reports that are of interest to you.

Whether you were trained in a physical, biological, medical, social, or behavioral science or in engineering you will do yourself a professional service by keeping abreast of the continuing stream of reports issued by the National Research Council. Here are just a few, indicating the diversity of subject matter:

ENERGY CHOICES IN A DEMOCRATIC SOCIETY

ISBN 0-309-03045-5; 1980, 135 pages, paperbound, \$6.50. Assembly of Engineering—Explores pictures of our society as imagined by futurists, examines the consequences of the breeder reactor and solar energy, and considers two scenarios in which the U.S. is assumed to curtail its demand for energy—all in the year 2010.

PROTECTION AGAINST DEPLETION OF STRATOSPHERIC OZONE BY CHLOROFLUOROCARBONS

ISBN 0-309-02947-3; 1979, 392 pages, paperbound, \$8.75. Assembly of Mathematical and Physical Sciences—A study of the alternatives and costs, feasibility, and timing of possible methods for controlling chlorofluorocarbon emissions.

THE EFFECTS ON HUMAN HEALTH OF SUBTHERAPEUTIC USE OF ANTIMICROBIALS IN ANIMAL FEEDS

ISBN 0-309-03044-7, 1980, 376 pages, paperbound, \$10.25. Assembly of Life Sciences—Examines what is known about possible hazards to human health from resistant bacteria and the toxicological and immunological consequences that might arise from antimicrobial residues in meat. Reviews published and unpublished epidemiological and other scientific data on this complex problem.

ISSUES IN CONTROLLED SUBSTANCE USE: Papers and Commentary

ISBN 0-309-03041-2; 1980, 183 pages, paperbound, \$8.25. Assembly of Behavioral and Social Sciences—Four major position papers presented at the Conference on Controlled Substance Use address the nature and impact of psychosocial and biological controls on substance use behavior.

CONTROLLING AIRBORNE PARTICLES

ISBN 0-309-03035-8; 1980, 114 pages, paperbound, \$8.00. Environmental Studies Board, Commission on Natural Resources—Reviews current knowledge about ambient concentrations of particulate matter and assesses the availability of scientific and technical information necessary for developing control strategies.

WOMEN SCIENTISTS IN INDUSTRY AND GOVERNMENT: How Much Progress in the 1970's?

ISBN 0-309-03023-4; 1980, 56 pages, paperbound, \$5.00. Commission on Human Resources—Examines the extent to which the employment situation of women scientists has improved since the advent of affirmative action mandates.

CONVERSION OF TROPICAL MOIST FORESTS

ISBN 0-309-02945-7; 1980, 205 pages, paperbound, \$12.50. Assembly of Life Sciences—Provides an in-depth assessment of the world's tropical moist forest (TMF) biome in more than 40 countries and the forces that threaten its survival. Reviews specific TMF areas that are undergoing pressures from increased human populations and others that have already become exceptionally endangered.

OCEANOGRAPHY IN CHINA

ISBN 0-309-03046-3; 1980, 106 pages, paperbound, \$7.00. Commission on International Relations—Reports on the state of oceanography and marine science in the People's Republic of China. Considers research and practice in biology, chemistry, geophysics, shelf geology, physical oceanography, and shore processes.

Fisher has what it takes to do it.

An unequalled selection of HPLC-grade solvents, water, inorganic buffers, derivatizing agents, ion pair reagents. All are tailor-made for sensitive HPLC procedures. All are stocked at Fisher branches to smooth your HPLC workload.

A series of uniquely stringent QC tests guarantee their fitness for interference-free HPLC. Solvents and water, for example, are tested to determine their purity for HPLC. The results of this and other rigorous tests are printed on the label of every bottle. Thus: guaranteed quality,

bottle-to-bottle, lot-to-lot.

As an extra convenience, have your Fisher branch set up a Customer Reserve Quantity arrangement, reserving HPLC reagents for you alone, and shipping to meet your timetable. You can even reserve an entire lot, guaranteeing total uniformity month-in, month-out.

Send for our new HPLC catalog today.

Fraction collectors from LKB span a range of capability and cost— every one provides LKB reliability

RediRac: portable—
economical—variable
tube size

MultiRac: overhead
microprocessor—
programmable—solvent
resistant

UltoRac: rugged—easy
to use—200 tube capacity

The three fraction collectors LKB makes today range from a portable circular unit to one with microprocessor control that can collect from microliters to gallons. Each is engineered from a bench worker's viewpoint—a fact of life for us from the time we made equipment for Svedberg and Tiselius.

Some say LKB uses circuitry, mechanical systems, materials of construction and QC methods which far exceed normal requirements. *Nostra culpa*. We believe in giving good value for money no matter how simple or sophisticated the instrument. Far better than compromising quality for price.

And if you ever need service, you get it fast from LKB without having to ship your unit back to us. (Money-saving service contracts are available.) Even better—we can furnish in-depth training for *your own* service people.

Reliability of design, reliability of manufacture, reliability of service: they all add up to reliability of performance. Is it prudent to settle for anything less? Contact LKB today for information on RediRac®, UltoRac® and MultiRac™ fraction collectors.

LETTERS

Contribution to the Ellipsoid Algorithm

The recently publicized polynomial time ellipsoid algorithm for linear programming has generated much excitement and activity among both researchers and press (News and Comment, 2 Nov. 1979, p. 545). We wish to add some historical remarks concerning the genesis of these ideas.

The Khachian paper (1) refers to earlier works of Shor (2) and of Judin and Nemirovsky (3). However, because the paper by Judin and Nemirovsky has not yet been translated, the full significance of their work and its major contribution to the polynomial time solution of the linear programming problem is only now becoming apparent. One of our aims in this letter is to stimulate the translation of this and other of Nemirovsky's works.

We summarize here the linear programming problem and the contribution of the papers by Nemirovsky and the head of his division, Judin, to its solution.

The problem is to find a solution with a given accuracy of a system of linear real inequalities or to determine its unsolvability. In the discrete version the coefficients are rational, and it is required to determine the exact solvability. As is well known, this is equivalent to the approximate solvability with a high enough accuracy. The required accuracy is easy to find, since the set of solutions forms a polyhedron, whose vertices are rationally expressible in terms of the coefficients of the system. Judin and Nemirovsky's 1976 paper (3) gives the ellipsoid algorithm for solving the continuous version with an *explicitly* stated polynomial upper bound on the number of steps. The formulation of the results is suitable not only for linear but also for convex inequalities. The paper refers to an earlier paper of Shor (2); however, Shor's gradient descent method was not sufficiently developed or specified to provide a polynomial upper bound. The main contribution of Khachian's paper (1) was a reformulation of Judin and Nemirovsky's paper for the discrete case.

Since the publication of Khachian's paper, and its explication by Gács and Lovász (4), many researchers have proposed improvements of the ellipsoid algorithm. We note, however, that improvements were already presented (3, 5) (sphere method, dimension reduction, and so forth). We believe this parallelism

shows how unfortunate it is that Nemirovsky's papers are unknown and untranslated. Perhaps this is because Nemirovsky does not have the advantage of working in a well-known institution, nor of having these papers published by well-known journals.

Nemirovsky is a scientist of the highest caliber whose major field is pure mathematics, in particular, functional analysis. We urge our colleagues to seek out and translate his papers and books.

Confidentiality: Rights and Responsibilities

The article by Gordis and Gold on privacy and confidentiality in medical records research (11 Jan., p. 153) is an excellent statement about the rights and obligations of scientists in a search for an equitable balance between the information needs of the biomedical research community and the individual rights of patients and research subjects to confidentiality and privacy. It is made even more valuable by its original presentation as congressional testimony on behalf of the professional societies whose members' activities are directly affected by such ethical and legal issues, and as such it is a noteworthy public contribution by these societies.

The article does not mention, however, a new policy question that has emerged in the context of balancing researchers' rights with the public's right

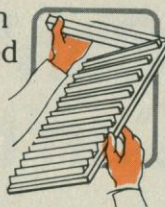

Believe it or not

there is only one water jacketed CO₂ incubator you can get really clean.

Combats contamination.

In the Napco 7000 series water jacketed automatic CO₂ incubator the shelf standards and plenums can be easily removed in less than five minutes, then autoclaved or swabbed. This

leaves an empty, perfectly smooth stainless chamber that can be swabbed for easy management of spores and contaminating organisms.

All other water jacketed automatic CO₂ incubators have permanent protuberance resulting in difficult to clean corners and angles where organisms can remain to contaminate future experiments.

This is just another exclusive benefit of Napco®.

who invented the water jacketed CO₂ incubator, automatic CO₂ controls, and the famous internal temperature probe that assures accurate temperature reading of the chamber.

Available in single or space saving vertical models. Write for brochure.

If you should ever have an equipment breakdown... **a Heinicke/Napco Minute Man will be on his way to you in 48 hours.**

You'll seldom need the Minute Man service, because Heinicke and Napco instruments are built to work. But if you do, dial toll-free 800-327-9783.

As easy as 1·2·5

If you've been wishing you could get rid of the inconvenience and difficulties of iodinating proteins, here is an easy way to do it. Get our simple, reliable Radioiodination System [^{125}I] – everything you need, ready for your protein.

We've selected a mild reaction method (enzymatic lactoperoxidase) to preserve your protein specificity. We've made sure that there are no contaminants to interfere

with proper iodination. And we've tested each lot in a complete iodination procedure.

The ingredients are: Sodium iodide [^{125}I], iodination reagent, sodium phosphate buffer, 1% β -D-glucose to activate the system, and a volatile radioiodine trap.

This system is the new way to make iodination straightforward and reliable. Send for the protocol to start saving time and trouble.

Not for use in humans or clinical diagnosis.

Can't See? Can't Study!

One camera used a
Javelin Night Viewing Device

Javelin, with the widest range of Night Viewing Devices (NVDs) and accessories in the world makes your study easier to perform and your results more complete.

Whether you're studying the effects of pollution on hermit crabs or the social habits of insects or mammals, or working in the laboratory, it's a 24-hour a day endeavor. Javelin's NVDs will help you observe all facets of their activity without exposing them to any unnatural light, not even infrared, thus eliminating an extra variable in your study.

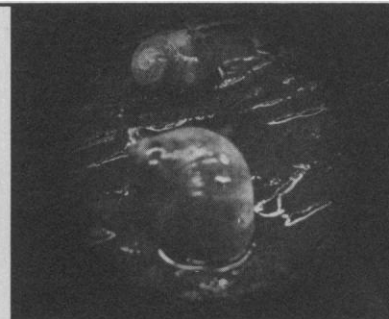

With a Javelin NVD you can study and photograph subjects in almost total darkness because the NVD provides a light gain greater than 50,000 times.

Two of Javelin's NVDs are particularly well adapted to scientific projects because they use a variety of lenses easily interchanged, connect and disconnect from various cameras quickly and are simpler to operate than your 35 mm camera. Using an NVD

and Photo Adaptor you can shoot in almost total darkness with a lens setting of f/4 using ASA400 film and view or shoot objects as close as ten inches or as far as 2,000 meters.

Our Javelin 221 is the most popular device for relatively short distances. Lightweight, it adds less than two pounds to your camera. The focal plane iris of this model allows you to reduce the field of view to concentrate on the particular portion of the screen of the greatest importance. For convenience, this model also mounts on a light tripod.

The Javelin 226 is a larger unit especially designed for long distance viewing. It features a biocular viewer, allowing you to stand twelve inches back of the NVD and look with both eyes, like watching TV. This viewer is on a swinging door mount with an optional adjacent swinging door to attach a television or photographic or movie camera. During field research you can view the scene by using the biocular view-

er and, within seconds, "change doors" to position a camera to photograph the scene. The model 226 weighs 13.5 pounds, heavy enough to support large telephoto lenses, but light enough to be easily transported.

Both models use an Automatic Brightness Control to eliminate adjustments when scanning from dark to illuminated areas. Gain is adjusted automatically.

Whether your project takes you underwater or above, whether it involves tagging prairie dogs or hospital research and evaluation, Javelin has done it all. Call us concerning your project. We may be able to get you out of the dark.

to know. The request (1) by the National Institutes of Health to the Department of Health, Education, and Welfare Ethics Advisory Board for a review of a proposed additional exemption to the Freedom of Information Act (FOI) for epidemiological and clinical research data raises a topic of concern that should be brought to the attention of the broader scientific community and the public beyond the researchers and the government agencies immediately affected. In the proposed FOI exemption for preliminary research data, the traditional rights of scientists to analyze incomplete data outside the arena of public review are recognized. This would minimize the premature release of misleading and incomplete research findings. Researchers and the government also have a responsibility, however, to make available for review and criticism evidence supporting scientific claims used in formulating public policies. The "timing" of access to preliminary research data may place this right and responsibility in conflict.

The AAAS Committee on Scientific Freedom and Responsibility has identified this issue of proposed FOI exemptions for research data as an important topic for future discussion. The committee invites individuals from the scientific community and the public to express opinions on the proposed exemptions in correspondence to the committee office at the AAAS address. These opinions will be used as a basis for future examination of this issue and will be forwarded to appropriate government offices when and if the proposed exemption is drafted.

Recombinant DNA in PARIS France

We are a new company specializing in recombinant DNA research. Backed by the largest French chemical and pharmaceutical group (involved in industrial biotechnology since the time of Pasteur) we have deliberately created an independent organization to develop creative interrelationships within our research team.

Do you want a challenging career?

We are looking for additional specialists with proven ability in using recombinant DNA techniques (several years of successful experience) to initiate and participate in our recombinant DNA program.

Highly qualified personnel in our private company receive attractive salaries and all the general advantages of the employment system in France. Knowledge of French is not necessary.

Qualified applicants are invited to submit a resume and range of salary requirements, in confidence to:

Dialog – world's biggest single source of online technical information.

Technical and scientific literature searching has certainly come out of the stacks. Thanks to computers, there are faster, more thorough ways to work.

Clearly the best of those ways is the Dialog Service for these reasons:

What Dialog gives you.

At your fingertips, in a matter of seconds, are technical reports, journal articles, conference papers and patents in every scientific and technical field. The information you can get from Dialog covers every field from aerodynamics to zymology—and it goes back 10 years or more. It includes the latest business databases that cover government controls, regulations affecting industry, raw materials, supply data, new product development, and economic trend data keyed to new industries.

The reach of Dialog.

It's worldwide. And it includes more than 100 databases and 30,000,000 abstracts and references

embracing all fields. No other retrieval service is close to Dialog in size or scope. Dialog also is within reach financially. The cost of a search is surprisingly low, as little as \$10 in some cases.

How close is Dialog to you?

Dialog probably is at your organization's library. Many people do their own Dialog searches in their lab or office. All you need is a standard computer terminal and telephone. What's more, Dialog is online over 110 hours a week.

Ask your librarian about Dialog and the ways it can help you tap into the knowledge explosion in your field. Or write Lockheed Information Systems, Dept. SC, 3460 Hillview Avenue, Palo Alto, CA 94304. In the U.S.A., call toll-free (800) 227-1960; in California, (800) 982-5838.

When you buy monoclonal antibodies for research from New England Nuclear, you can be sure they are made and tested to the standards of quality traditional in our radiochemicals. These hybridoma-produced immunoglobulins show exceptionally high specificity and titer, confirmed by assay, with results and other technical data included in your shipment.

Then there are the intangible benefits, which you can easily make tangible by calling us toll free. Our technical staff will gladly share with you the experience we have gained in building this major new product line, including the application and behavior of monoclonal antibodies under experimental conditions.

First let us have your name, so we can send you current product information and place you on our mail list, which guarantees that you'll be kept apprised of new developments. We intend to make this the finest and widest line of monoclonal antibodies available for research use. Please circle the inquiry number, or write.

And, oh yes, the coffee cup. It's free when you become a customer (and quite appropriate for use during your dialogue with our staff).

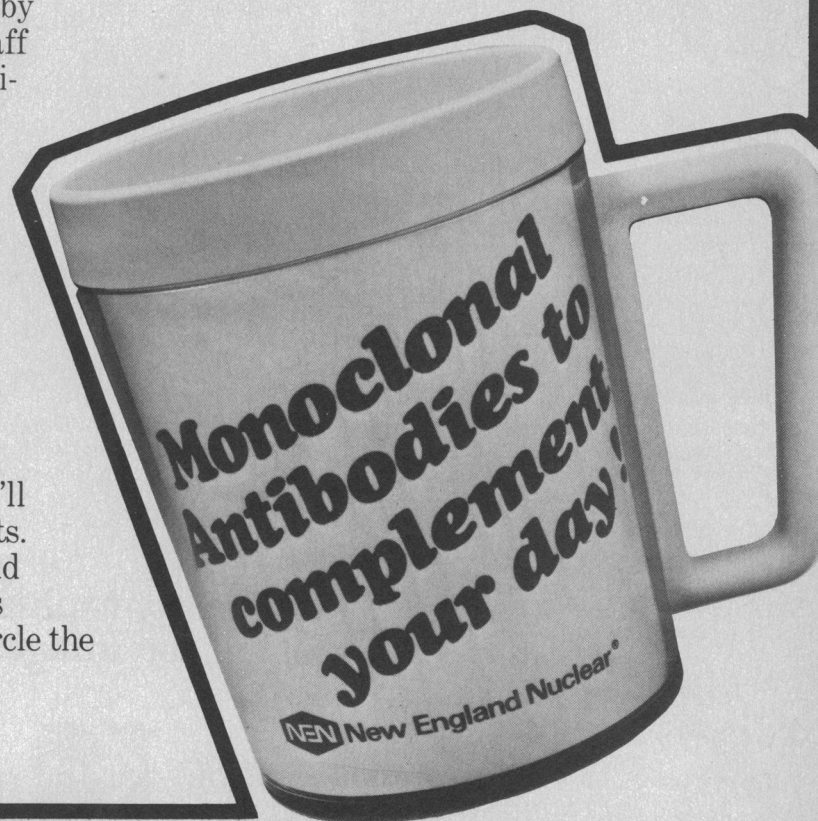

Not for use in humans or clinical diagnosis.

We appeal to your technical needs.

KODAK Technical Pan Film 2415 helps you record the sun and nearly everything under it.

What do you call a film you can use for solar flare photography, photomicrography, line-scan recording with cathode-ray tubes, lasers, or light-emitting diodes, photographing holographic reconstructions, and also for making black-and-white slides?

We call it KODAK Technical Pan Film 2415. You might call it "a film for all focal lengths," because it has been used rewardingly to record imagery with high-power microscope objectives, astronomical telescopes, and all sorts of camera lenses in between.

This extraordinary film, previously introduced as SO-115, is intended for

a wide range of applications requiring high resolution, extremely fine grain, processing flexibility, high D-max, and relatively flat spectral response through most of the visible spectrum. It is coated on ESTAR-AH Base.

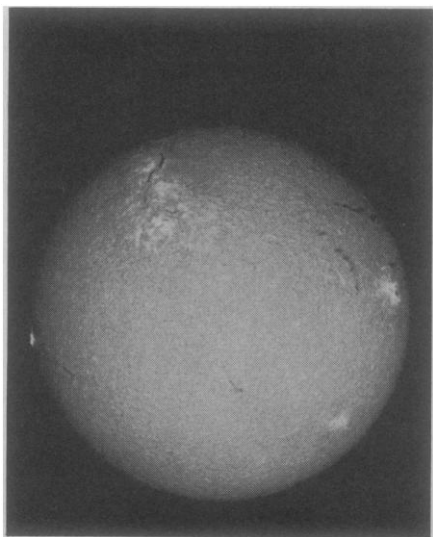

Its unusual combination of performance characteristics allows Technical Pan Film to fill a void in the matrix of black-and-white photorecording films. These characteristics have made 2415 a worthy successor to KODAK Solar Flare Patrol Film (ESTAR-AH Base) SO-392 and KODAK Photomicrography Monochrome Film SO-410—and a valuable alter-

native to KODAK High Contrast Copy Film 5069 in most applications.

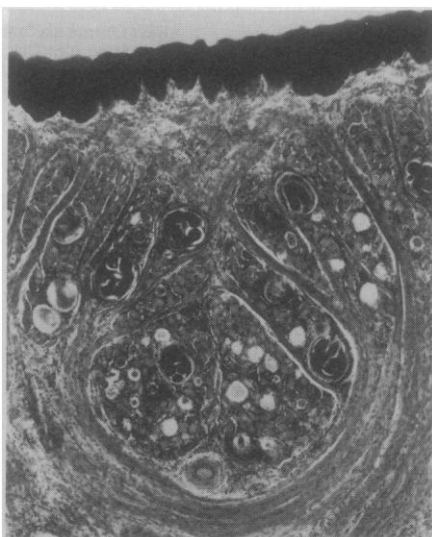

You won't find a Kodak film with a broader range of scientific and technical applications. At the same time, you may wish to load a roll into your 35 mm camera to record some stunning pictorial photography.

For additional information on Technical Pan Film, write to Eastman Kodak Company, Department 412L-153, Rochester, NY 14650. (A brief indication of your application may help us respond more effectively.)

Energy from Biomass

Many countries are showing increasing interest in obtaining larger fractions of their energy from biomass. Their efforts were described when leading experts in bioenergy from 76 countries met on 21 to 24 April in Atlanta to conduct a World Congress and Exposition on Bio-Energy. At the meeting it was evident that Brazil, China, Sweden, and the United States are leaders in the field. The Brazilian program is impressive, especially in the production and use of alcohol. At present, most Brazilian automobiles burn gasohol, which in their case usually contains 20 percent alcohol. But the Brazilians are moving beyond gasohol to employ only alcohol as a motor fuel. This year, Brazil plans to build 250,000 cars that are designed to burn alcohol and will convert another 70,000 or 80,000 existing automobiles to use it. The source of their fuel is fermentation of sugar from sugarcane, and scores of distilleries are being built in rural areas. The Brazilians are also looking to other sources such as cassava roots and eucalyptus trees.

Another interesting effort to expand the use of biomass is being made by Sweden, which is in the initial stages of a program to shift away from 70 percent dependence on imported oil. The Swedes face a very difficult situation; they have no coal, no oil, no natural gas. Prudence and economics dictate that they adapt to other energy sources. Fortunately, a large area of the country is covered with trees. At the congress they stated that there is sufficient forest potential to shift to wood as a prime source of energy, and they can even visualize that the gross national product could increase while they do so. They plan to grow fast-rotation trees that can be harvested every 3 to 5 years and are experimenting with willow and birch. The trees are mowed down and the wood is collected in the winter. The next spring, new shoots arise from the stumps, so that the tree does not have to use energy in establishing a new root system.

The efforts of the People's Republic of China to produce methane from biomass wastes are very impressive; they have about 7.5 million biogas installations. In many developing countries, a shift to production of biogas methane would take away pressure to use forest products. One of the dark things that is happening today in many countries is that the forests are being cut down for cooking fuel, with consequent deforestation and ultimate soil erosion. In the southern part of the People's Republic of China, replacement of wood with methane derived from human and animal wastes helps make it feasible to have a program of reforestation.

In the United States we are conducting at least 600 or 700 different research and development projects that are aimed at increasing use of bioenergy. New results are being obtained, but to me the most impressive thing at this conference was the display of equipment at the exposition. Particularly noteworthy was a machine that could reduce a sizable tree, branches and all, into chips, each about the size of a dollar, in about 30 seconds. Other pieces of equipment were designed to handle the collection and processing of biomass. One item was a portable device that encompassed all phases necessary to obtain alcohol from grain, including grinding, making the mash, fermenting it, and distilling the alcohol.

One of the problems of processing biomass is that the material usually must be collected and hauled to a production plant. Transportation costs can be high. Why not bring the processing to the biomass? It was amusing to see an exhibit of a piece of mobile equipment that could pyrolyze crop waste residues to combustible gas, fuel oil, and char. The gas is used to furnish heat and power to the equipment, which is then self-sufficient.

Many of the other exhibits at the exposition were items capable of playing a role in small, decentralized energy systems. These displays made it evident that soon other ingenious and useful devices will be available that will make the processing and use of biomass much easier and more practical, thus facilitating the transition to a larger role for bioenergy.

—PHILIP H. ABELSON

HIGHER ACCURACY AT HIGH CAPACITY GET HIGH ON SUPER RANGE ELECTRONIC BALANCES ONLY BY SARTORIUS

Only Super Range combines high capacity with higher accuracy.

Super Range is an expanded weighing range to the full capacity of the balance, resulting in higher readout accuracy. With Super Range, you can weigh 400 grams to 0.001g (Model 1265MP, above left), or 4,000 grams to 0.01g (Model 1364MP, above right). Balances with 'dual range' or 'movable fine range' cannot match this readability when weighing to full capacity.

With Super Range, the final decimal place never disappears.

Super Range avoids the confusion of the 'disappearing' final decimal place common to 'movable fine range' balances when weighing to full capacity.

With Super Range, the number of decimal places in the readout is constant, regardless of sample weight.

Today's most advanced balances to meet the needs of tomorrow.

Super Range Balances are microprocessor-equipped and feature instant electronic taring, built-in BCD output to interface with printers and calculators, adjustable integration time, and large, bright 7-segment displays. Super Range is another weighing first from Sartorius.

For literature, write: Sartorius Balances Division, Brinkmann Instruments, Inc., Subsidiary of Sybron Corporation, Cantiague Road, Westbury, N.Y. 11590, or call 516/334-7500.
