

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Science serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

Editorial Board

1980: RICHARD E. BALZHISER, WALLACE S. BROECK-ER, CLEMENT L. MARKERT, FRANK W. PUTNAM, BRYANT W. ROSSITER, VERA C. RUBIN, MAXINE F. SINGER, PAUL E. WAGGONER, F. KARL WILLENBROCK

1981: PETER BELL, BRYCE CRAWFORD, JR., E. PETER GEIDUSCHEK, EMIL W. HAURY, SALLY GREGORY KOHLSTEDT, MANCUR OLSON, PETER H. RAVEN, WILLIAM P. SLICHTER, FREDERIC G. WORDEN

Publisher

WILLIAM D. CAREY

Editor

PHILIP H. ABELSON

Editorial Staff

Managing Editor

ROBERT V. ORMES

Assistant Managing Editor

JOHN E. RINGLE

News Editor: BARBARA J. CULLITON

News and Comment: WILLIAM J. BROAD, LUTHER J. CARTER, CONSTANCE HOLDEN, ELIOT MARSHALL, R. JEFFREY SMITH, MARJORIE SUN, NICHOLAS WADE, JOHN WALSH

Research News: RICHARD A. KERR, GINA BARI KOLATA, ROGER LEWIN, JEAN L. MARX, THOMAS H. MAUGH II, ARTHUR L. ROBINSON

Administrative Assistant, News: SCHERRAINE MACK.
Editorial Assistants, News: FANNIE GROOM, CASANDRA WATTS

Consulting Editor: ALLEN L. HAMMOND

Associate Editors: ELEANORE BUTZ, MARY DORFMAN, SYLVIA EBERHART, RUTH KULSTAD

Assistant Editors: MARTHA COLLINS, CAITILIN GORDON, STEPHEN KEPPEL, EDITH MEYERS, LOIS SCHMITT

Book Reviews: KATHERINE LIVINGSTON, *Editor:* LINDA HEISERMAN, JANET KEGG

Letters: CHRISTINE GILBERT

Copy Editor: ISABELLA BOULDIN

Production: NANCY HARTNAGEL, JOHN BAKER; ROSE LOWERY; HOLLY BISHOP, ELEANOR WARNER; MARY MCDANIEL, JEAN ROCKWOOD, LEAH RYAN, SHARON RYAN

Covers, Reprints, and Permissions: GRAYCE FINGER, *Editor:* GERALDINE CRUMP, CORRINE HARRIS

Guide to Scientific Instruments: RICHARD G. SOMMER

Assistant to the Editors: JACK R. ALSIP

Membership Recruitment: GWENDOLYN HUDDLE

Member and Subscription Records: ANN RAGLAND

EDITORIAL CORRESPONDENCE: 1515 Massachusetts Ave., NW, Washington, D.C. 20005. Area code 202. General Editorial Office, 467-4350; Book Reviews, 467-4367; Guide to Scientific Instruments, 467-4480; News and Comment, 467-4430; Reprints and Permissions, 467-4483; Research News, 467-4321. Cable: Advancesci, Washington. For "Instructions for Contributors," write to the editorial office or see page xi, *Science*, 26 September 1980.

BUSINESS CORRESPONDENCE: Area Code 202. Membership and Subscriptions: 467-4417.

Advertising Representatives

Director: EARL J. SCHERAGO

Production Manager: GINA REILLY

Advertising Sales Manager: RICHARD L. CHARLES

Marketing Manager: HERBERT L. BURKLUND

Sales: New York, N.Y. 10036: Steve Hamburger, 1515 Broadway (212-730-1050); Scotch Plains, N.J. 07076: C. Richard Callis, 12 Unami Lane (201-889-4873); Chicago, Ill. 60611: Jack Ryan, Room 2107, 919 N. Michigan Ave. (312-337-4973); Beverly Hills, Calif. 90211: Winn Nance, 111 N. La Cienega Blvd. (213-657-2772); Dorset, Vt. 05251: Fred W. Dieffenbach, Kent Hill Rd. (802-867-5581).

ADVERTISING CORRESPONDENCE: Tenth floor, 1515 Broadway, New York, N.Y. 10036. Phone: 212-730-1050.

Electronic Data Bases

Profound changes are occurring in the creation, processing, storage, retrieval, and transmission of scientific numerical data. The power and convenience of electronic instrumentation has led to its wide use in laboratories. Digitized data from such equipment can readily be stored and processed. They can be retrieved and transmitted to other equipment both here and abroad through telecommunication networks. In many areas of science and technology large electronic data bases are being created that can also be tapped through the networks. Improvements in very large scale integrated circuits and memory devices, together with development of additional software, guarantee a great expansion of the role of electronic data.

New electronic devices have made possible experiments and observations not previously attainable and the accumulation of data at unprecedented rates. This is true throughout the natural sciences. The exploration of Jupiter by the Voyager spacecraft was completely dependent on electronic sensing devices, communication of signals to the earth, storage of the data in memories, and subsequent machine processing. The Geosynchronous Environmental Operational Satellite measures visible and infrared spectra of the earth's disk every 30 minutes and produces 2×10^{11} bits of data every day.

Many processes in nature occur in very short times. An important research frontier today is picosecond chemistry. Through the use of lasers and electronic sensing devices, much information is now being gathered about excited states of atoms and molecules. Details of the mechanisms of photosynthesis are being studied. When light falls on a plant, excited states are produced, electrons are transferred, spectral changes take place. These phenomena occur in time spans of microseconds or less.

New instrumentation has had profound effects on analytical chemistry. The most striking one has been to create the capability of identifying and measuring very tiny amounts of substances. By employing a combination of gas-liquid chromatography and mass spectrometry, biochemists have been able to isolate and measure 0.1 picogram of a hormone. With other equipment, analyses can be made much more rapidly than heretofore. A new spectrophotometer produces an entire spectrum from 200 to 800 micrometers in only 1 second.

A major hazard in hospitals is errors of transcription, which sometimes run as high as 5 percent or more. Modern hospitals try to avoid such errors in clinical laboratories by using electronic devices and storing results in a computer. A similar situation exists in pharmaceutical laboratories, which must maintain records of exemplary quality. Every measurement possible, such as weighing, is conducted with equipment that ties into the computer.

Electronic storage of digital data is the only feasible means of dealing with information in areas of science where it is produced at such a great rate that placing it on paper would be impractical. In addition, once the massive amounts of data are in machine-retrievable form, they can be processed and analyzed quickly and with a thoroughness beyond human capability.

Computers can communicate with each other, and this is being facilitated by public and private networks. Traffic is increasing rapidly. In large part this is due to the establishment of commercially available data bases, which are expanding in scope and numbers. The data bases will be helpful in pure science; they are already proving very valuable in applied research, and industrial organizations are willing to pay well for tapping them. In fields such as chemistry, solid state physics, and metallurgy, international competition is arising among compilers and vendors. We are in the early phase of important changes in electronic data handling. The federal government has been moderately helpful in furthering these developments, but expansion of its support is in order.—PHILIP H. ABELSON
