

Information for Contributors

The Editors of *Science*

Papers published in *Science* often receive far more attention than papers published in specialty journals. As a consequence, the rate of submission of papers is high—about 5000 manuscripts are submitted each year. The rejection rate of about 80 percent contrasts with that of most specialty journals, which is usually about 30 percent. Most of the material submitted to *Science* is of good quality and worthy of publication, and virtually all the scientific papers are eventually published somewhere. In selecting papers for *Science*, the editors must consider the needs of a broad audience. Insofar as the input of manuscript permits, preference is given to items that seem to be of general significance.

General Information

Four types of signed papers are considered: Articles, Reports, Letters, and Technical Comments. The author's membership in the AAAS is not a factor in selection. Papers are considered with the understanding that they have not been published and are not under consideration elsewhere. Authors will usually be notified of acceptance, rejection, or need for revision in 6 to 8 weeks (Reports) or 8 to 10 weeks (Articles).

Outside reviews. Almost all Articles and Reports, including those solicited by the editor, are sent to two or more outside referees for evaluation. Referees suggested by authors are used at the discretion of the editors. Papers that depend on statistical inferences for their conclusions may be sent to statisticians (in addition to other referees) for review.

Length limits. Papers that exceed the length limits cannot be handled expeditiously and in some cases will be returned without review. The limits are stated below in number of pages based on standard-size pages (8½ by 11 inches) typed with double spacing throughout (including the references and notes) and with 1-inch margins.

1) Articles: Up to 20 pages of text, including the references and notes, and

one table or figure for approximately every three manuscript pages.

2) Reports: Up to seven pages of text, including references and notes, and two tables or figures that together will occupy no more than half a printed page.

3) Letters: Up to 250 words.

4) Technical Comments: Up to two pages of text, including references and notes.

Selection of Manuscripts

1) Articles: About half the Articles published in *Science* are solicited by the editor. Both solicited and unsolicited Articles undergo outside and in-house review. Articles are expected to (i) provide a review of new developments in one field that will be of interest to readers in other fields, (ii) describe a current research problem or a technique of interdisciplinary significance, or (iii) present a study of some aspect of the history, logic, philosophy, or administration of science or a discussion of science and public affairs. Readers should be able to learn from a technical Article what has been firmly established and what are significant unresolved questions; speculation should be kept to a minimum. Preference is given to Articles that are well written, well organized, and within the length limit. Balance of subject matter in *Science* is an important consideration when a choice is made between acceptable Articles.

2) Reports: Reports are selected on the basis of reviewers' comments and an in-house review. Reports are expected to contain solid research results or reliable theoretical calculations. Preference is given to those that describe departures or discoveries that will be of broad interdisciplinary interest or of unusual interest to the specialist. In making the final selection, the editors take into consideration (i) the reviewers' comments: reports most likely to be accepted are those that receive persuasive outside reviews favoring publication; (ii) clarity of presentation within the prescribed length

limit; and (iii) subject matter in relation to that of other papers on hand. An attempt is made to balance the subjects of Reports so that one discipline is not overrepresented to the exclusion of others.

3) Letters: Letters are selected for their pertinence to material published in *Science* or because they discuss significant problems of interest to most scientists. Letters of a highly technical nature are usually transferred to the Technical Comments section. Letters pertaining to material published in *Science* may correct errors, provide support or agreement, offer different points of view, clarify, or add information. Outside reviewers may be consulted on questions of accuracy. Insinuations and conjecture about another author's motives, abilities, or intelligence are considered inappropriate for publication. The selection of letters is intended to reflect the range of opinions received.

4) Technical Comments: Technical Comments may be selected for publication if they express significant criticisms of papers published in *Science* or offer useful additional information. Technical Comments are usually sent for an opinion to the authors of the original papers before being reviewed. Discussions of minor issues or priority claims are not deemed appropriate, nor are questions that can be resolved by correspondence between the critic and the original authors.

5) Book Reviews: The selection of books to be reviewed and of reviewers is made by the editors.

Submission of Manuscripts

Submit an original and two duplicates of each manuscript together with a letter of transmittal giving:

- 1) the name(s) and telephone number(s) of the author(s);
- 2) the title of the paper and a statement of its main point;
- 3) the names, addresses, telephone numbers, and fields of interest of four to six persons in North America but outside your institution who are qualified to referee your paper;
- 4) the names of colleagues who have reviewed your paper; and
- 5) the fields of interest of readers who may want to read your paper.

Manuscript Preparation

Typing. Use double spacing throughout the text, tables, figure legends, and references and notes.

Units of measure. Use metric units. If measurements were made in English units, give metric equivalents.

Symbols and abbreviations. Define all symbols, abbreviations, and acronyms.

References and notes. Number references and notes in the order in which they are cited in the text. Place references cited only in tables or figure legends after the text references. Gather all acknowledgments into a single, brief statement at the end. Use *Bibliographic Guide for Editors & Authors* (American Chemical Society, Washington, D.C.) for abbreviations of journal titles. For journals not listed there provide the full title. Use the following forms:

For a journal paper: H. Smith, *Am. J. Physiol.* **98**, 279 (1931).

For a book: F. Datchille and R. Roy, *Modern Very High Pressure Techniques* (Butterworth, London, 1961), pp. 163-180.

For a paper in a compilation: F. Datchille and R. Roy, in *Reactivity of Solids*, J. H. de Boer, Ed. (Elsevier, Amsterdam, 1960), p. 502.

For unpublished material: A. Giraud, paper presented at the American Nuclear Society Conference, Washington, D.C., November 1976.

Illustrations. For each illustration submit three copies of a quality suitable for reproduction. Label each on the back with the name of the author and the figure number. Plan figures for the smallest printed size consistent with clarity. Color may be used if necessary but authors are billed accordingly. Cite all illustrations in the text and provide a brief legend for each.

Tables. Type each table on a separate sheet, give it a number and title, and cite it by number in the text. Give each column a heading. Indicate units of measure in parentheses in the heading for each column, and do not change the unit of measure within a column.

Equations and formulas. Use quadruple spacing around equations and formulas that are to be set off from the text. Define all symbols.

Special Requirements and Procedures

1) **Articles:** Provide a title of one or two lines of not more than 26 characters and spaces each; a brief author note giving your position and address; and a summary of 50 to 100 words. The summary should convey to the general reader the main point of the paper and outline the results or conclusions. The introduction should portray the broad significance of the work, and the whole text should be intelligible to scientists in different disciplines. Explain all technical terms likely to be known in only one field. Insert short subheadings at appropriate places in the text to mark your main ideas. Provide a reference list in accord with *Science* style. Reference lists should not be exhaustive; citation of a single review article can often replace many references. A maximum of 40 references is suggested.

2) **Reports:** Provide a title of one or two lines of not more than 54 characters and spaces each, and an abstract of 50 to 75 words. The abstract and the first portion of the report should portray for the general reader the results described and their significance. The body of the report should be intelligible to scientists in other fields of expertise. Complete documentation need not be presented but should be available in cited references.

3) **Letters:** Letters should be short (up to 250 words) and to the point; they should be carefully phrased, free of technical jargon, and nonrepetitive. When a Letter refers to an Article published in *Science* the original author is usually given an opportunity to reply. Letters are frequently shortened and edited. Letters are acknowledged by postcard; authors are notified if their letters are accepted for publication. Letters must be typed with double spacing.

4) **Technical Comments:** Technical Comments on Reports or Articles are published at the end of the Reports section. When a Technical Comment is accepted for publication the authors of the

original paper are usually given an opportunity to reply.

5) **Book Reviews:** Instructions accompany review copies when they are sent to reviewers.

Printing and Publication

Editing. Before being sent to the printers, papers are edited to improve accuracy and effectiveness of communication. When changes are needed because the author's meaning is not clear, the editor may consult the author by telephone; when the editing is extensive, the manuscript may be returned to the author for approval or further adjustment before the type is set.

Proofs. One set of galley proofs is provided for each paper. Alterations should be kept to a minimum and marked only on the proofs. Extensive alterations may delay publication.

Scheduling. Papers are not scheduled for publication until *Science* has received corrected galley proofs from the authors. The median delay between acceptance of papers and mailing of galley proofs to authors is 4 to 8 weeks (allowing for editing and typesetting); the median delay between receipt of authors' galley proofs by *Science* and publication is 4 to 6 weeks (allowing for proofreading, layout, and paging). There may be additional delays in publication for papers with tables or figures that present problems in layout and for papers accompanying cover pictures.

Reprints. An order blank for reprints accompanies proofs.

Cover Photographs

Particularly good photographs that pertain to a paper being submitted will be considered for use on the cover. Submit prints (not slides, negatives, or transparencies) together with the manuscript, and indicate in the letter of transmittal that a possible cover picture is enclosed.

Washington Tapes

AAAS Annual Meeting and Exhibit
Washington, DC 1982

For a list of those sessions taped at this year's Annual Meeting and Exhibit write to
Product Marketing Office
1776 Massachusetts Avenue, NW
Washington, D.C. 20036

(Program abstract included with each title)

SAVE 58%

Annual review and revision by a world-wide network of authorities makes the 62nd Edition of the CRC Handbook of Chemistry and Physics the newest presentation of this classic, personal reference.

Each year's edition is updated with the latest information of current demand yet retains the data you most frequently need.

Now only
\$24.95

You'll quickly find what you're looking for in this comprehensive resource of over 2300 pages of graphs, tables, formulas, and property information.

And what a find at only \$24.95 — a 58% savings on its regular \$59.95 cover price.

Order Form

Rush me the 62nd Edition of the CRC Handbook of Chemistry and Physics for only \$24.95*
(regularly \$59.95)

To qualify for this special offer, each order should:

- specify catalog number 462KSS
- be prepaid direct to CRC Press
- be postmarked by May 15, 1982

Enclosed is my check/money order for \$ _____

Name _____

Co./Inst. _____

Address _____

City _____ State _____ Zip _____

* Outside U.S., \$28.95 per copy. Payable in U.S. currency or draft on a U.S. bank. Florida residents add 4% sales tax.

COVER

An inert reentry vehicle from a U.S. Air Force Minuteman III launched from Vandenberg Air Force Base, California, streaks to an impact at Kwajalein missile range in September 1980. Similar tests in the Soviet Union led to a decision by the United States to build the controversial MX missile. See page 30. [U.S. Army]

The American Association for the Advancement of Science was founded in 1848 and incorporated in 1874. Its objects are to further the work of scientists, to facilitate cooperation among them, to foster scientific freedom and responsibility, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress.

TIAA Cuts Life Insurance Costs Again! Third Reduction in Seven Years.

While everything else has been going up in price, the cost of life insurance from Teachers Insurance and Annuity Association has been coming down steadily. New, higher cash dividends declared for 1982 have the effect of further reducing the low net cost of providing financial security for your family through TIAA. **The result: your insurance dollar today buys about twice the coverage it would have bought in 1975.**

Independent studies confirm that what you pay for TIAA coverage is well below the cost for similar policies with companies that serve the general public. To see what tremendous purchasing power your life insurance dollars have with TIAA, find the age closest to yours in the tables below, which illustrate net outlays to buy \$50,000 and \$100,000 of family protection on the 5-Year Renewable Term Plan:

Examples of Net Outlays * for TIAA 5-Year Renewable Term Policies

	\$50,000 Policy			\$100,000 Policy		
For a man aged	25	35	45	25	35	45
For a woman aged	30	40	50	30	40	50
Annual Premium	\$129.00	\$186.50	\$387.00	\$258.00	\$373.00	\$774.00
Cash Dividend	60.50	97.00	198.50	141.00	214.00	417.00
Yearly Net Outlay*	68.50	89.50	188.50	117.00	159.00	357.00
Outlay per \$1,000	1.37	1.79	3.77	1.17	1.59	3.57

*Net outlay is annual premium less cash dividend payable at end of policy year, based on continuation of current scale; although dividend amounts cannot be guaranteed or estimated for the future, TIAA has paid dividends every year since 1918.

**Call us toll free for personal illustrations.
Dial 800-223-1200
(In New York, call collect: 212-490-9000)**

A professional TIAA insurance counselor will be glad to discuss your family protection needs with you, and to send full information by mail on TIAA policies issued at your age. Or, if you prefer, just complete the coupon at right.

There's no obligation, of course, and no one will visit you because TIAA employs no sales agents. Whether you think you need life insurance or not, don't you owe it to yourself to learn exactly what TIAA's new, lower insurance costs could mean in helping you secure your family's financial well-being for the years ahead?

Eligibility for TIAA personal life insurance is limited to employees of colleges, universities, private schools and certain other nonprofit educational and research institutions. The employee's spouse is also eligible, provided more than half of the combined earned income of both husband and wife is from a qualifying institution. A TIAA life insurance policy is yours to keep, regardless of any change in your employment.

Established as a Nonprofit Service Organization by
the Carnegie Foundation for the Advancement of Teaching.

SCIENCE/SCOPE

The oldest, continually-operating communications satellite celebrated its 15th year in orbit recently. Though designed to serve just three years when launched in December 1966, NASA's ATS-1 satellite continues to provide people of the Pacific Ocean region with a valued link for communications ranging from medical emergencies to classroom instruction. The cylindrical satellite with spiderlike whip antennas has logged more than 915 million miles through space. The Hughes-built ATS-1 is in orbit 22,300 miles above Christmas Island.

Though tantamount to being tied to a rifle bullet, an extremely pure steel wire carries guidance signals in flight to the U.S. Army and Marine Corps TOW (Tube-launched Optically tracked, Wire-guided) anti-tank missile. The wire is manufactured by U.S. Steel Corp. under exacting conditions to obtain the rare combination of high tensile strength and high ductility, or ability to bend. After the gunner fires the missile, two strands of wire peel off twin bobbins in the tail of the missile at velocities approaching the speed of sound. Guidance commands reach the missile automatically as the gunner keeps the target in his cross hairs. The wire enables the Hughes TOW to have one of the highest velocities and longest ranges (2.3 miles) of any wire-guided missile in the world.

A military laser device manufactured in areas as clean as a hospital operating room is designed for rugged use in swamps, desert, or snow. The U.S. Army's Laser Target Designator enables ground troops to pinpoint targets for aircraft and laser-homing weapons. Forward observers use the rifle-like device to fire an invisible beam of laser pulses at a target. These coded pulses reflect from the target like a beacon and are detected by laser sensors in aircraft or by laser-homing missiles, bombs, and projectiles. Hughes manufactured the devices with stringent cleaning measures because laser optics can be contaminated easily by microscopic chemical compounds. The designators are hermetically sealed and built to withstand the rough treatment they would receive in the field.

A complete computer-controlled millimeter-wave test system permits the user to measure return loss, insertion loss, and gain over full waveguide bandwidths up to 110 GHz with a 0-to-25 dB measurement range. The solid-state Hughes 4788xH system has an optional automatic frequency control that allows the frequency of the test generator to be set with an accuracy of plus or minus 0.01 percent. The analyzer consists of the Hughes 4772xH millimeter-wave sweep generator, a Hewlett-Packard HP-85 computer, a full-band reflectometer with 40 dB directivity couplers and calibrated standard, and an analyzer with a built-in display.

Hughes is seeking engineers to develop advanced systems and components for many different weather and communications satellites, plus the Galileo Jupiter Probe. Immediate openings exist in applications software development, data processing, digital subsystems test, microwave/RF circuit design, power supply design, digital communications, signal processing, spacecraft antenna design, system integration test and evaluation, and TELCO interconnection. Send your resume to Tom W. Royston, Hughes Space & Communications Group, Dept. SS, Bldg. S/41, M.S. A300, P.O. Box 92191, Los Angeles, CA 90009. Equal opportunity employer.

Prospects for Support of R & D in Fiscal 1983

A Consortium of Presidents of AAAS Affiliated Societies met in Washington on the afternoon and evening of 15 March. Scientific and engineering societies having total memberships of more than 1 million were represented. The purpose of the meeting, which was organized by AAAS staff and presided over by Margaret Burbidge, president of AAAS, was to discuss the proposed fiscal 1983 federal budget for R & D and to obtain an estimate of the appropriations that will ultimately be made. Sources of information included Senator Pete Domenici (R-N.M.), Representatives Newt Gingrich (R-Ga.), Claudine Schneider (R-R.I.), and Doug Walgren (D-Pa.), and the President's science adviser, George Keyworth. Congressional staff members who participated were Fred Bernthal, administrative assistant to Senator Howard Baker (R-Tenn.); Hunter Spillan, House Appropriations Committee; and Michael Telson, House Budget Committee.

The picture that emerged was one of considerable uncertainty. At best, overall appropriations for support of academic research will rise slightly, though dropping somewhat in constant dollars. At worst, appropriations for research could drop substantially.

For the meeting and also for distribution on request, AAAS staff coordinated the preparation of a 145-page document that analyzes in detail President Reagan's proposed budget.* Sixteen organizations collaborated in the preparation of the publication.

The mood of the afternoon session was to a large degree gloomy. The pattern was set by the two Democratic staff members of the House. Telson said that in the interval 1980 to 1985 entitlement programs, including Social Security and Medicare, will increase from \$291 billion to \$410 billion. Defense expenditures will grow from \$136 billion in 1980 to \$292 billion in 1985. In contrast, discretionary programs, of which civilian research is a part, will drop from \$117 billion in 1980 to \$66 billion in 1985. In 1983, the discretionary portion of the budget is slated to drop to \$84 billion. In these circumstances, research is being treated far more favorably than other items in the major category that includes it. In the intense political infighting that will occur this election year, science will be a target. Spillan emphasized that research is very easy to cut. Many individual congressmen prefer to obtain highly visible public works for their districts. Spillan also pointed out that if there is a budget compromise and some tax cuts are eliminated, the additional funds will not go to research. They will be used to diminish the budget deficit.

In spite of this threat to support of research, a question by Bernthal drew an unexpected answer. He asked, "What is the major concern of the audience?" The consensus reply was science education at all levels and especially support for graduate students. The afternoon's proceedings were summarized by Allan Bromley, past president of AAAS, who added his own views on the subject, emphasizing that we should not lose sight of the need for better science education in the secondary schools so that when science-based issues arise an informed public will deal with them.

The evening session was dominated by Republican lawmakers. They were optimistic about support of research. The luminary with by far the greatest weight is Senator Domenici. He is chairman of the Senate Budget Committee, and when a compromise on the budget is sought he will be a key factor in reaching it. Domenici asserted that he is a strong supporter of science and that there is a comparatively large number of Ph.D.'s in his state. However, he was blunt in saying that support for military preparedness must be increased, but changes in the total budget must be restrained.

Science adviser George Keyworth has emphasized that the Administration understands that basic research is a federal responsibility. But with discretionary expenditures under extreme pressure defenders of science in both parties need to be assured by their constituents that their efforts are recognized and appreciated.—PHILIP H. ABELSON
