

## American Association for the Advancement of Science

*Science* serves its readers as a forum for the presentation and discussion of important issues related to the advancement of science, including the presentation of minority or conflicting points of view, rather than by publishing only material on which a consensus has been reached. Accordingly, all articles published in *Science*—including editorials, news and comment, and book reviews—are signed and reflect the individual views of the authors and not official points of view adopted by the AAAS or the institutions with which the authors are affiliated.

**Publisher:** Alvin W. Trivelpiece

**Editor:** Daniel E. Koshland, Jr.

**Deputy Editors:** Philip H. Abelson (*Engineering and Applied Sciences*); John I. Brauman (*Physical Sciences*)

## EDITORIAL STAFF

**Managing Editor:** Patricia A. Morgan

**Assistant Managing Editor:** Nancy J. Hartnagel

**Senior Editors:** Eleanor Butz, Ruth Kulstad

**Associate Editors:** Martha Collins, R. Brooks Hanson, Barbara Jasny, Katrina L. Kelner, Edith Meyers, Phillip D. Szurmi, David F. Voss

**Letters Editor:** Christine Gilbert

**Book Reviews:** Katherine Livingston, *editor*; Deborah F. Washburn

**This Week in Science:** Ruth Levy Guyer

**Contributing Editor:** Lawrence I. Grossman

**Chief Production Editor:** Ellen E. Murphy

**Editing Department:** Lois Schmitt, *head*; Mary McDaniel, Barbara E. Patterson

**Copy Desk:** Joi S. Granger, Beverly Shields, Anna Victoreen

**Production Manager:** Karen Schools

**Assistant Production Manager:** James Landry

**Graphics and Production:** Holly Bishop, James J. Olivarri, Eleanor Warner

**Covers Editor:** Grayce Finger

**Manuscript Systems Analyst:** William Carter

## NEWS STAFF

**News Editor:** Barbara J. Culliton

**News and Comment:** Colin Norman, *deputy editor*; William Booth, Mark H. Crawford, Constance Holden, Eliot Marshall, Marjorie Sun, John Walsh

**Research News:** Roger Lewin, *deputy editor*; Deborah M. Barnes, Richard A. Kerr, Jean L. Marx, Leslie Roberts, M. Mitchell Waldrop

**European Correspondent:** David Dickson

## BUSINESS STAFF

**Business Staff Manager:** Deborah Rivera-Wienhold

**Classified Advertising Supervisor:** Karen Morgenstern

**Membership Recruitment:** Gwendolyn Huddle

**Member and Subscription Records:** Ann Ragland

**Guide to Biotechnology Products and Instruments:** Shauna S. Roberts

## ADVERTISING REPRESENTATIVES

**Director:** Earl J. Scherago

**Traffic Manager:** Donna Rivera

**Traffic Manager (Recruitment):** Gwen Canter

**Advertising Sales Manager:** Richard L. Charles

**Marketing Manager:** Herbert L. Burkland

**Sales:** New York, NY 10036: J. Kevin Henebry, 1515 Broadway (212-730-1050); Scotch Plains, NJ 07076: C. Richard Callis, 12 Unami Lane (201-889-4873); Chicago, IL 60611: Jack Ryan, Room 2107, 919 N. Michigan Ave. (312-337-4973); San Jose, CA 95112: Bob Brindley, 310 S. 16 St. (408-998-4690); Dorset, VT 05251: Fred W. Dieffenbach, Kent Hill Rd. (802-867-5581); Damascus, MD 20872: Rick Sommer, 24808 Shrubbery Hill Ct. (301-972-9270); U.K., Europe: Nick Jones, +44(0)64752918; Telex 42513; FAX (0392) 31645.

**Information for contributors** appears on page XI of the 18 December 1987 issue. Editorial correspondence, including requests for permission to reprint and reprint orders, should be sent to 1333 H Street, NW, Washington, DC 20005. Telephone: 202-326-6500.

Advertising correspondence should be sent to Tenth Floor, 1515 Broadway, NY 10036. Telephone 212-730-1050 or WU Telex 968082 SCHERAGO.

## Materials Science

**M**aterials science is currently one of the most vital areas of research and development. This was evident in Boston in early December at the annual meeting of the Materials Research Society. A broad spectrum of topics was treated in 18 symposia, including those on superconductors, advanced processes for microelectronics, plasma deposition of diamonds, and catalysts.

The 90 K superconductors have captured attention around the world. Thirty percent of the 260 papers or posters on the topic were furnished by contributors from 22 countries. There have been few times in human history when a scientific finding has been replicated by so many investigators so rapidly in so many places. Many different preparative procedures were mentioned, and the products examined by a variety of instruments. Two impediments to some large-scale applications remain. Thin films of oxides such as  $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$  can carry up to  $10^6$  amperes per square centimeter. But superconductivity vanishes when a substantial magnetic field is present. A second impediment is the difficulty of forming a flexible wire from the superconductors. Bell Laboratories announced a substantial advance (see Research News, 18 Dec., p. 1649). By melting the oxide and cooling it in a controlled way, they obtained a product that can carry  $1,000 \text{ A/cm}^2$  in a magnetic field of 10,000 or more gauss. Many applications will require 10 to 100 times greater currents in larger magnetic fields. The Bell Labs people are optimistic that they can make further progress.

Information processing is becoming the largest industry in the world. Further rapid progress in microelectronics seems guaranteed. During the past 3 years, there has been a 400 percent increase in the density of memory bits, and the practical limit recedes as a result of the ingenuity of scientists and engineers. Excimer lasers employing XeCl, KrF, or ArF are being used to make experimental chips having features with dimensions as small as 0.5 micrometer. The use of molecular-beam epitaxy continues to grow, permitting the construction of complex sandwiches of differing materials with layers a few atoms thick. Ion beams of oxygen with energies of the order of 200 kiloelectron volts are being employed to form an insulating layer of  $\text{SiO}_2$  within a silicon wafer. A beam of cobalt can yield an internal conducting layer of cobalt silicide within silicon.

The large-scale synthesis of diamonds has long been a goal of industry. Diamonds are employed extensively in machine tools, and were synthesis of diamonds easy, they might be used with advantage as semiconductors. Diamonds and graphite are both forms of pure carbon, but it is graphite that is stable thermodynamically. In the 1950s, scientists and engineers at General Electric were able to produce diamonds in an apparatus capable of  $5500^\circ\text{C}$  and pressures of 2.8 million pounds per square inch. Now diamonds are being produced using plasma in a partial vacuum. The Russian Deriagin was a pioneer, but his papers were largely ignored. From 1983 on, however, there has been intense activity in Japan and recently in the United States. When a mixture of  $\text{CH}_4$  and  $\text{H}_2$  is introduced into a plasma, highly active and metastable forms of carbon and carbon-hydrogen entities are produced. When these metastable forms are adsorbed on a surface whose temperature is about  $900^\circ\text{C}$ , the carbon atoms form a crystalline structure. Sometimes the structure will be that of diamond, sometimes graphite. When a large fraction of the gas in the plasma is hydrogen, copious amounts of atomic hydrogen are made which reacts about a hundredfold faster with graphite than with diamonds. Thus nearly pure diamonds are the net product.

Industrial catalysts take many forms, one of which is a cave-like structure present in zeolites. Once process molecules enter the caves, they encounter active sites that catalyze reactions. In the past, the size of the opening in zeolites limited the kind of molecule that could be processed. At the meeting, new structures having larger openings were described. These included pillared micas and a zeolite type of structure formed predominantly from alumina and  $\text{P}_2\text{O}_5$ .

At Boston many more topics were treated than those touched on above. A 564-page book devoted to the program and abstracts and of presentations provides a further indication of the international character and broad scope of the program.

—PHILIP H. ABELSON
