

procedural using the latest technology. Surely the scientists working with the STS and other science competitions can recognize and reward the students doing science against all odds without punishing those who have had the advantages. If we cannot, then we do not have the objectivity we lay claim to.

### Museum Molecular Lab

I was pleased to see treatment of an important trend in museum research toward molecular systematics ("Systematics goes molecular" (Research News, 22 Feb., p. 872). I must point out, however, that the discussion of the facility at the American Museum of Natural History does not fully reflect this institution's commitment to molecular systematics. The new laboratory is a \$1.8-million state-of-the-art facility for DNA sequencing, with bench space for more than a dozen researchers. Contrary to a statement in the article, our molecular lab is the essence of centralization. It is placed within the museum at the crossroads of three scientific

Shortly after our paper of 3 August 1990 on the molecular structure of charybdotoxin (1) was published, two independent determinations of the structure of this molecule appeared (2) that were similar to each other and in strong disagreement with ours. We have obtained new data and find that some spectral features depend on solvent conditions, which explains some differences between our data and those of the other groups. More important, we conclude that we most probably misassigned an important sequence of amino acids, as suggested by Bontems *et al.* (3). Therefore, we withdraw our previously reported structure (1) and regret any inconvenience it may have caused. We thank F.

## RAPD™ Primers. Rapid Mapping.

NEW  
PRODUCT!

Operon Technologies announces the availability of Random Amplified Polymorphic DNA (RAPD™) primer kits. Developed by du Pont, RAPD™ is a revolutionary new genetic mapping technology that has considerable advantages over RFLP methods. The RAPD™ technique uses single 10-base oligonucleotide primers to amplify DNA polymorphisms, which are useful as genetic markers (Williams *et al.* *Nucleic Acids Res.*, **18** 6531-6535). Operon Technologies now has hundreds of RAPD™ primers available for immediate shipment at economical prices. Call for details.
